They did fail, and I was summoned urgently to his aid. I packed my bag for an emergency, and asking my partner, Dr. G. W. Heinitsh, to accompany me, started for his father's home. I found him in the following condition: Pulse, 120, wiry and hard; temperature, 101½°, respiration, 34; and his face the picture of distress and suffering; features, pinched; knees, drawn up to their fullest extent; head and shoulders, elevated; abdomen, much swollen and extremely tender to the touch, all over,—the tympany encroaching upon the diaphragm, so as to greatly interfere with respiration. He was extremely ill, and his anxious, pinched features pointed to a result, not far distant, if help was not immediate. I decided at once to open the abdomen over the appendix, thinking from the tenderness of that point, that I might here find the trouble. Though formerly, most of the pain had been referred to the lower border of ribs—latterly, he had referred much of it to this region. He was a brave boy, and after listening to my reasons for an operation he decided to take his chances with the knife. I told him death would speedily ensue without, and the chances were against him even with it. In this Dr. Heinitsh fully concurred.

Five years before, he had had measles and was quite sick. After this a pain had come in the right side where now it was located, and it had since followed him continually, causing him to walk and lean to the right side. While at work he had often to leave the field and go home and lie down, and for a day or two at a time would be unfit for his ordinary duties. He could not lie on the left side at all—a feeling of suffocation coming on immediately on turning on that side. The pain was described as a dull heavy aching, extending from the anterior border of the ribs of right side around to the spine. A little cold, over-eating, or constipation would aggravate it. He would get on to his knees when chopping wood in order to spare this side.

Preparations were made for an immediate operation. In the confusion incident to so serious a condition of a member of the family, everything was made ready with difficulty; fires kindled, water heated, while one pitcher with the handle broken was the only vessel in the house to bring water from the kettle to the basin. At length, everything being washed and scalded, ether was administered, whiskey, strych., and digitalis being first given. I made a three-inch incision in right umbilical region, one inch above the superior border of the ilium, and almost parallel with its descending portion, stopping just before reaching the external iliac which could easily be felt pulsating. Dr. H. was here invaluable to me, as he gave me assistance and watched the ether also, we having three neighbors to help in the way of holding basins, bringing water, giving ether, etc.

I quickly reached the abdominal cavity and found the very entrance blocked by old adhesions, everything hidden and effaced by one solid mass of adherent matter. Not one land-mark could be distinctly mapped out. I slowly detached the mass from the abdominal wall next to the ilium, thence upward toward the liver, thence toward the naval and finally into the pelvis. By great effort I brought a portion of what I thought to be the colon into view in the incision and saw as

ened, oozing surface. At this stage Dr. H. warned me that my patient was sinking, so without finishing all I desired to do, I hastily flushed the cavity with hot water from my one handleless pitcher and with stitches of silk twist closed the wound, dressed it with iodoform gauze and placed the patient in bed more dead than alive. He soon began to rally and in a few hours was restored from the shock. I left him believing he would die in twenty-four hours, thinking that I had not sufficiently broken up the adhesions to give relief. I left six ⅛ gr. calomel and soda powders, to be given in as many hours, and to be followed by saline and enemas. I also gave morphine and atropia hypodermically. I left him about 7 p. m.; at 11 p. m. bowels moved freely, also at 2 a. m. next day and again at 3, 5, 8, and 11 a. m. I saw him at this last hour. The abdomen was greatly distended; temperature 102.5°; pulse 120; volume better; respirations 30; countenance better; directed the use of calomel and salines to be continued during the following night. The patient could not relieve the bowels without rising to stool. This he had done without my knowledge, or consent; fortunately no bad results followed. I therefore introduced a rectal tube which obviated any further difficulties. His condition at this time was extremely precarious. There was great difficulty in breathing. He would frequently have to be raised to the upright position to prevent suffocation. I ordered 10 drops turpentine every four hours.

July 12th, third day, passed a restless night, temperature this morning 101½°; pulse 102; resp-20, abdomen softer; distension decreased; general condition improved; wanted food, surreptitiously took a chew of tobacco. I ordered three grains of quinine every four hours, the bowels to be kept open as before. Fourth day: Temp. 101°; pulse 96; resp. 22; all symptoms better; whiskey added to the treatment; bowels active. Fifth day: bowels ceased to move during the night; patient restless and anxious; temp. 102½°; pulse 110; resp. 26; his condition alarming. Calomel, soda and enema pushed as before. Sixth day: Temp. 99°; pulse 84; resp. 19. From this time on his condition steadily improved.

Conclusions: This case is a remarkable one, both as to its nature and results. His condition when I first saw him was, I had expected a florid, roughened, thick-apparently, not alarming. From the history as given after the operation when the family had quieted down and could go back over it composedly, I am of opinion that he had had repeated attacks of local peritonitis, and little by little, adhesions had been formed, until during this last, and most violent attack, it had advanced sufficiently to completely stop the passage of fæcal matter through the bowel. What the cause of this immediate attack was, I am not prepared to say. Possibly it was gall-stones, setting up peritonitis. The trouble has always been referred to the right hypochondriac region, and after the operation there was some distension at the point just over the gall-bladder. It was tender to the touch and he said that the pain there caused all the difficulty in his breathing. He could not lie upon the left side for a long time before the attack, and would often assume an erect position to keep from smothering. Since the operation, he can sleep in any position without pain. Had I been satisfied there had been *no* passage from upper bowel, at my first visit, I would not have waited until compelled to operate as a last resort.

This case teaches the real harm that may arise from the administration of cathartics where occlusion from any cause exists; this case was made worse by their use. These cases are usually neglected too long. Delay, until dangerous symptoms supervene—means, generally, death. I miraculously saved my patient, but under the same conditions and treatment, would probably lose as often as save.

Society Reports.

SOUTHERN SURGICAL AND GYNECOLOGICAL ASSOCIATION.

Fifth Annual Meeting Held in Louisville, Kentucky, November 15, 16 and 17, 1892.

(From Special Correspondent of MEDICAL AND SURGICAL REPORTER.)

NOVEMBER 15TH—FIRST DAY.

MORNING SESSION.

The Association met in the Council Chamber of the City Hall, and was called to order at 9.30 A. M., by the President. Dr. J. McFadden Gaston, of Atlanta, Ga.

An Address of Welcome was delivered by Dr. L. S. McMurtry, of Louisville, Chairman of the Committee of Arrangements, the response to which was made by the President.

The first paper read was by Dr. Bedford Brown, of Alexandria, Va., entitled: Personal Recollections of the Late Dr. Benjamin W. Dudley, of Lexington, Kentucky, and His Surgical Work.

The speaker paid an eloquent tribute to Dr. Dudley and characterized him as the greatest living lithotomist that this country has ever produced, and the most successful in the history of the world. The speaker's close relationship to Dr. Dudley as a private pupil and assistant for two years enabled him to present a clear and faithful sketch of his character and surgical work.

Experiences in Pelvic Surgery was the title of a paper read by Dr. A. V. L. Brokaw, of St. Louis, Mo.

Of all the surgical problems difficult to solve, it may be truthfully said, that those met with in the pelvis are the most trying. The speaker knew of no surgical work which will compare with the experiences found in the pelvis; a diversity of conditions, complications and unexpected happenings are ever presenting. In a series of many operations but few will be alike in every particular. As his experience became larger he was free to confess his inability to correctly diagnose the character of abdominal and pelvic troubles. He had diagnosed pus tubes and found extra-uterine pregnancy; diagnosed extra-uterine pregnancy and found pus; diagnosed ovarian lesions and found the trouble located in the tubes and *vice versa.* When well-defined pelvic lesions exist, nothing short of radical measures succeed. The one condition above all others where exploratory incision should be adopted was in cases of suspected extra-uterine pregnancy. It was correct and good surgery to open the abdomen and not wait for all the classical signs to appear. The symptoms of extra-uterine pregnancy were so frequently obscure and unreliable that he was firmly convinced a radical position should be taken. A case was cited in point.

DISCUSSION.

Dr. William Warren Potter, of Buffalo, desired to endorse that portion of the paper pertaining to an early exploratory incision in cases of suspected extra-uterine pregnancy. As regards the use of the sound he had brought an indictment against it some six or eight years ago, consequently he would not expatiate upon it at this time.

Dr. Joseph Taber Johnson, of Washington, said that as soon as the surgeon diagnosed something in the abdominal cavity that ought not to be there, anatomically or physiologically, and was histologically wrong, it should be removed. An exploratory operation was justifiable in cases of suspected extra-uterine pregnancy, and the surgeon should base his further procedures upon what he finds after making the exploration.

Dr. W. E. B. Davis, of Birmingham, Alabama, thought the pendulum relative to surgical interference had swung a little too far. He believed that a great many so-called "tinkerers," who succeeded in relieving their patients, did not accomplish it so much by the local treatment they used as by having patients under their care, keeping the bowels open, giving constitutional treatment, seeing them regularly, etc. While, by so doing, they might not be cured in all cases, they were greatly benefited. Regarding the diagnosis, surgeons who were opening the abdomen constantly would rarely give a positive diagnosis in the case. Dr. Davis cited the case of a woman who had an acute attack of peritonitis, and the history was the same as from pelvic abscess.

Dr. Brokaw, in closing the discussion, said that in every case of suspected extra-uterine pregnancy it was good surgery to make an exploratory incision and operate before rupture took place.

Craniotomy Upon the Living Fœtus Not Justifiable, by Dr. Cornelius Kollock, of Cheraw, S. C.

This operation implied the death of the fœtus and a frightful mutilation of its body, often accompanied by serious lacerations of the vagina and adjacent tissues of the mother. Recent advances in obstetrics, gynecology and abdominal surgery contribute largely to a demonstration of the fact that a timely resort to Cæsarean section in pelvic obstruction is the great factor to success. In Germany, out of 149 cases of contracted pelvis, 109 mothers and 136 children were saved. If craniotomy had been done in those cases

149 children would have been destroyed and probably fifty women—perhaps more, making a sacrifice of least 199 lives. In many of these section cases exhaustion had supervened and septic influences had already been excited. This added to a tardy disposition to union by first intention, caused by contusion of the parts involved in the uterine incision, lessened materially the women's chances for recovery. Zweiffel was successful in 29 cases out of 30; Schauta did Cæsarean section fifteen times without a single death. Recently in eighteen operations done in Louisiana, fourteen were successful. Of eight in Ohio, six were successful. Dr. Joseph Price has done Cæsarean section a number of times successfully. Dr. Kollock is firmly convinced that 85 or 90 per cent. of the cases of obstruction of the pelvis forbidding the delivery of the fœtus in the natural way, might be saved by a timely resort to Cæsarean section.

DISCUSSION.

Dr. W. D. Haggard, of Nashville, emphasized the position taken by Dr. Kollock. He believes that when the profession fully realizes the immense difference in the number of lives saved by Cæsarean section over craniotomy, there will be no doubt as to its preference to the latter operation.

Dr. Hunter McGuire, of Richmond, favored Cæsarean section. Some time ago he saw the report of a case by Dr. Thomas, of New York, where, in doing Cæsarean section, he proposed to take the uterus out of the cavity and then open it. He thought this added very much to the danger of the operation, necessitating a larger opening, exposing the cavity of the abdomen a long time to the atmosphere, etc. He does not favor this procedure.

Dr. L. S. McMurtry, of Louisville, said that a few years ago it would have been impossible for one to have presented the views that Dr. Kollock had without meeting with violent opposition. Cæsarean section was then regarded as an extremely heroic operation, and until recent years the mortality therefrom was very great; but since it has been carried to the present degree of perfection by Sænger and others it has strengthened the opinions of abdominal surgeons, who now consider it preferable to craniotomy. Within the last two months symphysiotomy ha been brought before the profession and practiced as an alternative in certain cases for Cæsarean section. What the future of the former operation is to be we are not prepared to say.

Dr. Arch Dixon, of Henderson, Kentucky, advised Cæsarean section in a case in which he was called in consultation, but the family physician insisted upon him doing craniotomy, which was done, and while every precaution was taken with regard to rendering aseptic the field of operation, the woman developed pelvic peritonitis and died within four days. He believed a Porro operation would have saved the life of the woman and perhaps that of the child.

A Case of Extensive Hematocele Resulting From Tubal Pregnancy Rupturing Into the Broad Ligament, by Dr. W. D. Haggard, of Nashville, Tennessee. (See page 881)

Fibroid Tumor of the Uterus; Pregnancy, Rupture About the Fourth Month; Operation. Reported by Dr. S. M. Hogan, of Union Springs, Alabama.

Specimen presented.—The woman, colored, was 28 years of age, and from the symptoms and history of the case, he was satisfied there was a rupture and the probabilities were that it occured about the fourth month of gestation. He was also of the opinion that the rupture did not immediately destroy the fœtus, but that it continued to grow in its abnormal position. The speaker felt sure that if he had operated on the case immediately after rupture, the patient's life would have been saved! In all cases of rupture he would advise Porro's operation to be done immediately; that in all cases, where the tumor is large or multiple, intramural or subperitoneal, with a sacciform dilatation of the posterior segment of the uterus, and the os above the pubic bone, or inaccessible, the same operation should be done. In all cases where the tumor is in front of the child, or blocking the passage it should be done, provided the pregnancy has advanced to the full time, or there should be a hemorrhage, or rupture of the membranes, indicating that an abortion or miscarriage is imminent.

AFTERNOON SESSION.

A New Operation for the Radical Cure of Inguinal Hernia, by Dr. Geo. A. Baxter, of Chattanooga, Tenn.

Dr. Baxter presented an operation radically different in principle from any yet given. It consists in a prolongation of the incision, after the ordinary management of the sac and after ligation, through the internal ring into a more or less extensive laparotomy as the exigencies of the case demand; lifting the neck of the sac into the abdominal opening above the ring and its fixation there by deep suturing, cutting off the sac close above the peritoneum and closing it by buried sutures; and a final closure of the abdominal opening by buried sutures and a more superficial set of sutures which pass across *above* the closed sac and peritoneum and *underneath* the deep fasciæ, and which are intended to approximate the homologous tissues of the abdominal wall. The ring is closed with crucial sutures dipping over cord and traversing the tissues, and the seminal canal closed with deep suturing alone.

Points of originality claimed: A line of incision suitable for any inguinal hernia; by the fixation of the sac above the peritoneum a deflection of all abdominal expulsive force from the ring and canal; the thickened lining of the internal ring; and the method of closure of abdominal incision. Advantages claimed: Quick cure with avoidance of necessity of truss; deflection of expulsive force from internal opening and canal to abdominal parietes; ability to approach constriction either from without or within; avoidance of necessity for traction on sac or contents; ample room for treatment in diseased conditions of sac or contents including gut operation if necessary.

The Cure of Inguinal Hernia in the Male, by Dr. Henry O. Marcy, of Boston.

Until recently the cure of inguinal hernia in the male had been considered as at the best accidental, and when apparently effected, was generally of doubtful permanence, and the hernia was liable to return. The great majority of surgeons look upon on attempt at cure as ill-advised and believe operative measures should not be undertaken except in cases of strangulation. Dr. Marcy thought there was abundant reason for such conclusion, when judged from the earlier history of surgical procedures as attempted for cure. The essential surgical considerations for the cure of hernia were as follows: *First*, strict aseptic conditions. These pertain alike to all modern surgical procedures. *Second*, a free dissection. This is necessary in order to lay bare the internal ring, to permit of the enucleation of the peritoneal sac, and the separation and elevation of the cord out of the wound. The external epigastric artery often courses in the line of the incision. It is not seldom that the size of this vessel is such that the operator fears he has wounded the larger vessel. *Third*, the disposition of the sac. The separation of the sac to its very base before removal is to be recommended as the rule. There are times, however, when it is not easy to free the peritoneal pouch, owing to adhesions to the surrounding tissues, and in large old irreducible hernia a more or less intimate fusion of the contents to the inner wall of the sac. It is generally better to open the sac before ligating or sewing through its neck, since by so doing the condition at the internal ring is assured and by such knowledge the operator is often profited even if the sac is completely empty, not seldom the omentum is adherent at the internal ring, and even a constricted loop of intestine may escape observation when it is attempted to return the sac unopened.

Dr. Marcy closed his paper by saying that between three and four millions of people living in the United States were subject to hernia; and, if the demonstration is complete that the risk of life is less than one per cent. from the operative procedures instituted for cure, and that scarcely more than ten per cent. are subject to relapses, and these almost invariably in a state improved by the operation, the plea is a very strong one, to consider favorably the advisability of operation in a very large majority of all the sufferers from hernia.

The Treatment of Umbilical and Ventral Hernia, by Dr. W. H. Wathen, of Louisville, Ky.

He said the importance of studying carefully the best methods of treating hernia is now especially emphasized because of the increased frequency of the disease following laparotomy, and especially because the modern methods of surgery make the operation far less dangerous than it formerly was. The operation for radical cure of hernia in the prac-

tice of the best surgeons, except in extreme cases, is practically devoid of danger, and the result may be made permanent. Modern antiseptic and aseptic precautions have practically excluded the danger which formerly arose from infective peritonitis. The author said there are many cases of ventral hernia that could have been prevented had the proper treatment been carried out in the closure of the abdominal wound. In order that there may be no hernia following laparotomy it is necessary to get perfect union by adhesion of all the layers of tissue forming the abdominal wall—the peritoneum, muscular, the deep and superficial fascia, and the skin, but especially must we get union of the layers of fascia, for unless this be done the other layers will gradually separate and hernia will follow. This cannot be unless we succeed in bringing the cut edges of the fascia in even and perfect apposition long enough for strong union to occur.

NOVEMBER 16—SECOND DAY.

MORNING SESSION.

DR. W. O. ROBERTS, of Louisville, read a paper on THE TREATMENT OF UNUNITED FRACTURES BY RESECTION. He said the treatment of ununited fractures by resection was more than a hundred years old, White of Manchester having done the first operation in 1760. In consequence of the great mortality attending the operation it was abandoned until revived by Sir Benjamin Brodie. In 1805 Horeau, after having divided the fragments obliquely, fastened them together by tying a metallic wire around them. Rogers, of New York, in 1838 passed the wire through holes drilled in the wall of the fragment and then twisted it. Since then other surgeons have used sutures of various materials in the same way; some of them leaving the sutures in permanently, while others removed them after union of the fragment had occurred. Some instead of drilling the bone passed the sutures simply through the periosteum. Screws, nails, ivory pegs and clamps have been used for the same purpose. In the long bones, where coaptation of the fragments can be secured, Dr. Roberts feels satisfied that resection and a fixed dressing will be followed by just as good results as when sutures or other contrivances for fastening the ends of the fragments together are used.

SYMPTOMS OF FRACTURE, THEIR IMPORTANCE AND SIGNIFICANCE. Dr. W. C. Dugan, of Louisville.

(To appear later.)

DISCUSSION.

DR. BEDFORD BROWN, of Alexandria, Va., related the case of a boy who sustained a compound comminuted fracture of the skull in 1860, yet he was perfectly conscious and had no symptoms of compression of the brain. The spiculæ of bone were removed, and recovery followed.

DR. J. H. LETCHER, of Henderson, Ky., advised against the too hasty resort to the use of trephine and chisel in injuries of the skull.

DR. C. KOLLOCK, of Cheraw, S. C., had trephined in two cases with successful results.

DR. J. H. MCINTYRE, of St. Louis, reported a case of traumatic insanity in a railroad employe in which he trephined with success. The fracture was an extensive one and occurred in the upper Rolandic region. He reported several other interesting cases.

DR. WILLIAM WARREN POTTER, of Buffalo, called attention to fracture of the internal table of the skull without fracture of the external; hence the great liability to error in diagnosis.

DR. HOWARD A. KELLY, of Baltimore, related the case of a man who fell and was brought to the Presbyterian Hospital in a comatose state. Careful examination revealed the fact that the man had diabetic cataract with fracture at the base of the skull.

DR. WILLIAM T. BRIGGS, of Nashville, had trephined in fifty cases of epilepsy. Four-fifths of the cases operated on were relieved temporarily but not permanently.

DR. T. A. REAMY, of Cincinnati, mentioned the case of a man who had fallen from the second story of a court house, sustaining a fracture of the skull, but had never had epilepsy or any bad symptom following the injury. He thought this case would be some comfort to the country practitioner who did not enlarge the scalp wound in all cases.

The papers were further discussed by Drs. Vance, Lydston, Nicolson, Greenly, and Baxter, all of them favoring radical measures in the treatment of injuries of the skull.

Dr. L. S. McMurtry, of Louisville, read a paper entitled Ovarian Cystoma with Twisted Pedicle and Peritonitis; Ovariotomy in Second Week of Typhoid Fever—Recovery.

(To appear later.)

Intestinal Anastomosis by a New Device. By Dr. H. Horace Grant, of Louisville, Ky.

For more than a year the speaker had been endeavoring to perfect some instrument to simplify direct suture, but it had been so difficult to get just what he wanted that time had not been allowed since the completion of the instrument to test it fully. It is to be used only after resections. The two blades of the clamp are oval scissors one-fourth of an inch in transverse and two and a half inches in longitudinal diameter. The arms of the clamp are made long enough to allow introduction of full five inches. After the gut is exposed, a strand of iodoform gauze is passed through the mesentery and constricts the intestine fully six inches from each point of intended resection. The mesentery is tied off over the portion to be resected with fine silk, in two-inch loops, cut close and dropped in the usual way. When the resected portion is removed the gut ends may be washed out if desired. While the two ends of the divided intestine are held parallel, one blade is entered in each, allowing at least one and one-half inches of gut beyond the proposed anastomotic opening to permit of invagination of the ends. The clamp is tightened and the two surfaces thus firmly held are rapidly stitched together by a continuous overhand Lembert suture of fine silk. Two rows of parallel sutures as suggested by Abbe may be used if desired, though it had seemed that one is enough according to the author's experiments. The work can be done far more rapidly and accurately than without the clamp. When the suturing is finished the clamp is tightened if need be, and a long bladed dressing forceps passed in the bowel and the oval plug removed or pushed in. The scissors action of the blades, together with the ten or fifteen minutes pressure prevents any hæmorrhage. The clamp is now withdrawn and the ends invaginated in the usual way.

DISCUSSION.

Dr. A. V. L. Brokaw, of St. Louis, thought the instrument exhibited by Dr. Grant a good one, and said that anything which materially assists the surgeon in making intestinal anastomotic operations rapidly was of great value; that time was a most important element. The use of rings, plates and mats in the past were bad. He believes that we can suture far more rapidly with Dr. Grant's instrument than with any other device he had thus far seen.

Dr. W. E. B. Davis, of Birmingham, Ala., believed a large number of operators had abolished mechanical devices in doing intestinal anastomosis. His brother (Dr. John D. S. Davis) had devised a rubber plate and mat, but now prefers not to use the plate. In the case of resection of the bowel he thought the device of Dr. Grant was an ingenious one, inasmuch as it would facilitate the work of the surgeon and enable him to do an operation very quickly. He had conducted a series of experiments in an effort to do away with mechanical devices, by which the surgeon might use the end to end operation by splitting up the bowel. While the operation was successful in some cases, the strain on the circulation was too great, and he now condemns the operation.

Dr. G. Frank Lydston, of Chicago, directed attention Dr. J. B. Murphy's anastomosis button, a recent device, by which he says cholecysto-enterostomies can be done in from eight to ten minutes.

AFTERNOON SESSION.

The Association was called to order at 2.30 P. M., with the First Vice-President, Dr. C. Kollock, in the chair.

The President delivered his Annual Address. He took for his subject, "Compatibility of Conservative and Aggressive Surgery."

The circumspect philosophy of former days taught us what man has done, man may do. But the developments of more recent times say whatever is practicable may be undertaken; without regard to precedents,—conservative and aggressive processes are combined in progressive surgery. Conservatism in the use of all the appliances of surgery is not inconsistent with the application of the most energetic means of relief in structural disorders. A misapprehension exists with many of our profession as to the true sphere of progressive surgery,

and it was the purpose of President Gaston on this occasion to make a distinction between rashness in the employment of operative measures and boldness in the use of surgical means of relief when clearly indicated. Real advances in surgical practice have not been the result of cutting and slashing without due consideration, but have accompanied the painstaking investigation of the conditions requiring the knife, and caution in the performance of operations. As a preliminary to any surgical procedure of a radical nature, correct diagnosis is essential, but to accomplish a proper understanding of a deep-seated disorder it is often requisite to make an exploratory operation of greater or less magnitude. The information based upon such an exploratory measure serves as a guide to any further surgical procedure. Dr. Gaston said that ignorance and inexperience often lead to sad results in meddlesome surgery, when limbs are sacrificed or organs mutilated, to gratify the desire to figure as a bold operator on the part of a would-be surgeon. In such cases no honorable member of the profession should shield the culprit from the charge of malpractice or from the assessment of damages by a court of justice.

A Plea for More Rapid Surgical Work, by Dr. Ap. Morgan Vance, of Louisville, Kentucky.

A great number of surgeons pay little attention to the time consumed in an operation, or to the nicety of manipulation and dexterous use of instruments that our forefathers prided themselves upon. He had seen on numerous occasions the work of our most distinguished surgeons, and had seen deaths occur from prolonged anæsthesia and too much time consumed in operation, which would not have taken place if much time had not been wasted unnecessarily. The habit of starting the anæsthetic before all preparations were completed was very reprehensible.

The paper was discussed by Drs. Arch Dixon, Rufus B. Hall, Geo. A. Baxter and Edwin Ricketts, all endorsing the position taken by the essayist.

Surgery of the Ureters with a Report of Cases, by Dr. Charles A. L. Reed, of Cincinnati, Ohio.

Surgery of the ureter is one of the developmental subjects of abdominal surgery. These out-of-the way conduits, exercising functions that are vital in character, were liable to diseased conditions which baffle the resources of the diagnostician and tax the ingenuity of the operator. For purposes of diagnosis the physical means at our disposal may be briefly summarized as follows: (1) Exploration of the lower end of the ureter by digital examination, (a) through the vagina, (b) the rectum, and (c) the bladder; (2) Exploration of the lower end of the ureters by the sound passed through the urethra and bladder into the ureters; (3) Exploration of the central portion of the ureters by abdominal lumbar palpation—an expedient of practical value only in cases of extreme urethral distension occurring in very thin subjects; (4) Exploration of the upper end of the ureters by exploratory nephrotomy. Each of these several expedients might be amplified, but it would be uncalled for here. Dr. Reed said that since catheterization of the ureters has been popularized in this country, and since the technique of the procedure has become understood by those who have studied it, the diagnosis of disease within and surrounding these tubes is vastly more common. The digital exploration through the urethra and bladder is an easy expedient so far as the surgeon is concerned and often leads to the elucidation of important pathological facts, but the speaker is forced to believe that it is not without danger to the patient. He has been forced into this belief by one case of incontinence lasting for nearly a year, and by two cases of weakened power of retention, one of which is now of quite two years' standing. Dr. Reed said that abdominal section for diagnosis of ureteral conditions, notably in cases of suspected calculus, is entirely justifiable. He then reported a case of peri-ureteritis; stricture; kolpo-cysto-ureterotomy, with recovery. The second case was one of cicatricial stricture of an excised ureter; hydro-nephrosis; nephrectomy, remaining urethral disease.

Specialism in Medicine, Particularly as Related to Surgery and Gynecology, by Dr. William Warren Potter, of Buffalo, N. Y.

His argument summarized is:

1. There is essential need for specialists. Divisions of labor in every field are

demanded, and nowhere more than in medicine.

2. Specialists being a necessity, they must equip themselves by years of study, and devote themselves to a still greater number of years of general practice before they are justified in offering themselves as specialists.

3. They must conduct themselves in such a way as to merit the respect of the general practitioner, and to invite his co-operation in their work.

4. The unwritten ethics of specialism demand that there shall be reciprocal relationship maintained, not only among specialists themselves, but also between specialists and general practitioners.

5. The opportunities for perfection in special lines of medical study are so great, and medical literature both journalistic and text-book, is so rich, that an awful responsibility is entailed.

6. The schools ought to discourage any and all students who give promise of entering upon the practice of a specialty as soon as the college doors are passed, and before the swaddling clothes of the professional tyro are slipped.

The General Practitioner as a Gynecologist, by Dr. R. M. Cunningham, of Birmingham, Ala.

The general practitioner should not undertake work that can be better and more safely done by the specialist, provided one is obtainable. He should be willing to do and attempt the most radical and dangerous operations when necessary to save life, provided a specialist or one better prepared to do the work cannot be obtained. In cases not necessarily dangerous, or in which life does not become more or less a burden, but in which a cure can be effected only by radical procedure, but which may be materially benefited, or symptomatically relieved by milder methods, he should adopt the latter and not the former. In many cases the field is clearly his own, belongs to him, and he should be prepared and competent to treat them with safety and success.

Specialism in Medicine, by Dr. W. F. Westmoreland, of Atlanta, Ga.

There are two kinds of specialists, the one with his preconceived ideas, which become warped, who always suffers from astigmatism, etc.; the other, the man who has worked his way by his generally acknowledged ability in any particular line.

A Preliminary Report on the Morphology of Ovarian and Myomatous Tumors, by Dr. Howard A. Kelly, of Baltimore, Md.

The form of abdomen characteristic of large ovarian cysts is a globular or ovoid distension of a part or the whole of the abdominal wall, pushing out the infra-umbilical portion much more than the supra-umbilical, at least so long as the tumor occupies the lower half or two-thirds of the abdomen. This enlargement is uniform in parovarian cysts and polycystic tumors; exhibiting but few bosses, due to the fact that the latter are composed of one or two large cysts associated with a mass of smaller ones, and the large cyst is best accommodated in the median line in the distended concave anterior abdominal wall, while the smaller ones at the side or back consequently do not show. Prominent exceptions to the general rule just enunciated that pelvic tumors distend most markedly the inferior abdominal zone are the notable stretching of the upper abdomen in very fat women with large ovarian tumors, and the like distension in rachitic dwarfs in advanced pregnancy. Nodular myomata on the other hand stand out in marked contrast to the smooth outlines of cystic tumors in giving to the lower abdomen a lumpy bossed appearance, thus exhibiting through muscles and skin a softened exaggeration of their irregular outlines. This peculiarity still remains prominent although softened, after these tumors have undergone fibro-cystic degeneration.

Cystic tumors filling the pelvis and part of the abdomen are but rarely found to originate in some upper abdominal organ. The speaker presented for demonstration a photograph of an enormous kidney, containing over a gallon of pus, extending from the pelvic floor up through the abdomen and pushing up the left ribs.

November 17—Third Day.

Morning Session.

Dr. A. M. Cartledge, of Louisville, read a paper entitled The Present Status of Drainage in Surgery. He presented the following summary:

1. The principle of artificial drainage

in surgery, while very ancient, was imperfectly understood, and was oftentimes as much a factor for evil as for good.

2. Though our knowledge of the principles which govern a healthy regeneration of wounded structures has greatly advanced, and our progress in wound therapeutics kept pace, we fail to appreciate how artificial drainage can be altogether dispensed with in surgical practice.

3. To lessen the use of artificial drainage it is necessary to thoroughly apply the principles of asepsis and antisepsis, combined with buried sutures, fixation, and alimentary or systemic drainage by purgation.

4. Where from any reason the production of a serum cannot be controlled, its removal by drainage is a safer surgical measure than any attempt at sterilization *in situ*.

5. The time required for primary drainage is from twenty-four to sixty hours; to wait longer is to encourage trouble, to remove sooner than twenty-four hours is taking risks not warranted in the premises.

6. Capillary is to be preferred to tubular drainage in wounds other than those of the large cavities. For this purpose absorbable material should be selected, catgut being the best.

7. Where it is desirable to combine hæmostasis and drainage in the same measure, the strips of iodoform gauze, as recommended by Mikulicz, fulfill a most useful purpose.

8. Where natural drainage can be utilized without producing unsightly cicatrices, artificial drainage should be dispensed with; when feasible combine the two.

9. Wounds involving the brain and cord had best be drained to avoid mechanical violence to the function of delicate structures by retained serum.

10. Necessity for artificial drainage will most often arise in wounds invading the large cavities; here inflexible tubular drains (glass) best meet the requirements, aided or not by materials acting by capillarity.

11. The method of secondary suture after primary wound secretion is over, advised by Kocher, seems to possess no advantage over drains that have to be removed, and certainly is not to be compared in convenience, comfort, etc., to the patient, to absorbable capillary drains.

The Treatment of Tubercular Peritonitis, by Dr. William H. Myers, of Fort Wayne, Ind.

When we have arrived at the conclusion that peritonitis is present, and have discovered the cause, the blow must be struck simultaneously with the onset. No delay can safely be tolerated, the only hope of rescue being the sudden arrest of the disease. By the time that the normal outlines of the abdomen are obscured by tympanitic distension, respiration quickened and shallow, the pulse rapid and wiry, the supreme moment for precise diagnosis is passed. Abdominal section for tubercular peritonitis was the most recent triumph of surgery. Dr. Myers had treated three cases of tubercular peritonitis by abdominal section, washing out the abdominal cavity and drainage, with complete recovery.

Bacteriological Research in its Relation to the Surgery of the Genito-urinary Organs, by Dr. G. Frank Lydston, of Chicago.

The author said that in his opinion modern bacteriological and pathological research has nowhere been more productive of scientific and practical progress than in the special field of genito-urinary surgery. He would not attempt to decide the question as to whether under certain circumstances the microbial organisms which are constantly to be found in the secretions of the genito-urinary tract, are causal factors in pathogenesis of various forms; or, on the other hand, to decide the precise relation of heterogenetic organisms to the same morbid processes. The relation between what may be termed the normal germ and germs of non-pathogenic properties must certainly be left to the practical microbiologist. We are warranted, however, in drawing certain inferences and making certain practical deductions from what we know of the evolutionary laws of progression, differentiation and adaptation to environment. Many of the diverse forms of disease of microbial origin were doubtless embraced under the omnibus term of urinary infection. The present state of our knowledge does not admit of arbitrary differentiation between them. It is sufficient to say that many forms of organic and functional change affecting the genito-urinary tract are of microbial origin. These processes range in severity from a general infection with

effusion and perhaps suppuration in joint cavities to so simple a local lesion as a chronic prostatic irritation. The author quoted the researches of such modern authors as Reginald Harrison, Halle, Rovsing, Krögius, Bumm, Albarran, and Cuyon.

Ovariotomy in Old Women, by Dr. Joseph Taber Johnson of Washington, D. C.

The author reported three cases, and felt quite sure that prolonged anæsthesia and manipulation within the peritoneal cavity would have proved fatal. The first patient was sixty-seven years of age, and the tumor removed weighed fifty-two pounds. The second case was one of multilocular ovarian tumor weighing sixty-four pounds. On October 10th, of this year, he removed an ovarian tumor weighing fifty-six pounds from a lady who was sixty-seven years old, but who looked to be 100. Improved methods, quicker operations, antiseptic technique and provisions against shock, show thirty-three cases between the ages of sixty-seven and eighty-two with only two deaths, against twenty-four cases, done twenty years ago, between the ages of sixty and sixty-seven with a record of six deaths. These figures demonstrate in addition to improved technique the surprising fact that old age is no contra-indication against ovariotomy.

The Simple, Septic, Traumatic and Specific forms of Cervicitis, and Their Treatment, by Dr. Bedford Brown, of Alexandria, Va.

Simple cervicitis arises alone from simple causes. It never originates from infection of any kind. It could exist for an indefinite period without affecting the surrounding structures. For many years the author in the treatment of this affection has addressed his remedies to the interior of the cervical canal alone, whether he used nitrate of silver, sulphate of copper, carbolic acid or iodine. Septic cervicitis arises always from septic infection and the pelvic structures are connected by lymphatic communication. Contact with the os of portions of putrescent placenta, membranes, coagula or septic discharges from diseased uteri were the common causes. Antiseptic measures alone could counteract septic infection and inflammation, whether in the form of septicæmic fever or local inflammatory action. All other agencies were simply palliative or adjuvant in character. Traumatic cervicitis was simply inflammation and congestion of the cervix from wounds inflicted on that body either during labor, abortion or the use of dilating instruments. The author treats this form of cervicitis by means of nitrate of silver, varying in strength to half a drachm to a fluid ounce of water applied in the canal and over the entire cervix. He finds that most of his cases of open and all cases of concealed wounds heal by this method. Specific cervicitis may arise from gonorrhœal or syphilitic infection. In the early stages he resorts to douches containing peroxide of hydrogen in the proportion of one part to three or four of boiled water, and also permanganate of potash, one grain to the ounce of water.

Shock, by Dr. James Evans, of Florence, S. C.

The speaker said in the severe injuries inflicted on the body by accident, and in the major operations of surgery, not the least element of danger to life is the condition known as shock which rapidly supervenes. The degree of shock is not determined solely by the extent and gravity of the physical injury. Certain idiosyncrasies of constitution, the character of the force which inflicted the injury, and the circumstances under which it occurred, are potent factors in its determination. Individuals of a highly wrought and exquisitely nervous organization bear pain with far less fortitude and are more susceptible to shock than those of dull and obtuse intellects and blunted sensibilities. The author reported a case in point. In laying the foundation of a bridge across the Pee Dee River in South Carolina, an immense block of granite weighing over a ton was being lowered into a pit forty-four feet in depth, at the bottom of which was a man who was to direct when it was in proper position. When this huge block of stone was suspended over the pit the cable holding it began to slip, and the man below was warned to crouch in a corner, as it would inevitably fall. The rock did fall, and the man in the pit miraculously escaped without injury, but he was taken out in a perfectly lifeless condition and was exceedingly ill for more than a week.

A Manipulative Mistake and its Consequences, by Dr. George Ross, of Richmond, Va.

The author related a case of a woman who had suffered from unremitting, agonizing tenesmus the result of a mass which she carried seven years in her bladder, and which proved to be on inspection a pledget of absorbent cotton once saturated with iodine, in shape a truncated cone, and thinly incrusted with phosphate of lime. The patient believed it was introduced by her first physician, who, when attempting to apply an intra-uterine dressing, mistook the urethra for the cervical canal.

Dr. William Perrin Nicolson, of Atlanta, Ga., made some remarks on Hare-lip Operations, in which he advocated the use of a simple suture instead of a pin, and also recommended paring the edges.

Cholecystotomy, with the Report of a Case, by Dr. Edwin Ricketts, of Cincinnati, O.

He had operated thirteen times for obstruction of the gall ducts. This patient, a lady, thirty-four years of age, married, consulted him last June. She had never suffered markedly from jaundice, nor from acute attacks of hepatic colic, no marked distension over the region of the gall-bladder; abdominal wall at least three inches in thickness; some general tenderness of the liver elicited by percussion. The patient had the characteristic putty-colored stools, and was losing flesh rapidly. The author advocated allowing a glass drainage tube to remain in until the common duct was opened, and then, if necessary, to make an anastomosis between the gall-bladder and the duodenum.

The following officers were elected for the ensuing year;

President: Dr. Bedford Brown, of Alexandria, Va.

First Vice President: Dr. Jos. Price, of Philadelphia.

Second Vice President: Dr. George A. Baxter, of Chattanooga.

Secretary: Dr. W. E. B. Davis, of Birmingham, Ala.

Treasurer: Dr. Hardin P. Cochrane, of Birmingham.

Place of meeting, New Orleans, La. Time, second Tuesday in November, 1893. Chairman of Committee of Arrangements, Dr. Albert Miles.

TOO MANY PHYSICIANS—A REMEDY.

That there are too many men engaged in the practice of medicine is generally admitted. That there are none too many of those fully qualified for their work is also as generally accepted. We cannot wait for the public to be sufficiently educated to discriminate between competent and incompetent service. We must take the advanced ground and be the teachers ourselves. Not only the remedy, but also the hour in which the remedy itself should be applied is at hand. Instead of scores of medical schools opening wide their door and crying, Come, let them nearly close these entrances and hedge up the way by a careful and discriminating examination. Let the weeding begin now, and let it keep up at regular intervals throughout the college course. First, there should be an improvement in the quality of the instruction imparted; second, the standard for admission should be raised; and third, the requirements for graduation should be far greater than at present. No school need fear for lack of patronage if it takes this advanced ground. The profession will rally to its support. Instances could be given where this has proved to be the case to a most flattering degree. Begin now to lessen the annual output of doctors, and unfair and often disgracefnl means of competition will cease. Commercial methods of obtaining a business will be no more and we will be in word and deed a noble profession.—*National Med. Review.*

ABORTIVE TREATMENT OF BUBOES BY WELANDER'S METHOD

This consists in injecting into the center of the bubo, by means of a hypodermic syringe, a one per cent. solution of benzoate of mercury, and then applying compression by a bandage. This must be done before suppuration occurs. A single injection in most cases is sufficient. Of the cases ninety-one per cent. and eighty-seven per cent., respectively, have been cured by the author and by Lebrick, of Odessa.—*La Revue Medicale.*

THE
Medical and Surgical Reporter

ISSUED EVERY SATURDAY

ADDRESS:

Care P. O. Box 843, Philadelphia

PENFIELD BROS., Publishers.

Terms. Five dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

Remittances should be made payable only to the publishers, and when in sums of five dollars or less should be made by Postal Note, Money Order or Registered Letter.

THE MEDICAL AND SURGICAL REPORTER.

SATURDAY, DECEMBER, 3RD, 1892.

DIPHTHERIA AND ITS RELATIONS. A TRULY ORIGINAL RESEARCH.

Health reports from different sections of this country and abroad show that diphtheria is unusually prevalent. For many years science has been devoting some of its best efforts to discover the nature of this disease, but it has been only groping in the dark. Clinicians have studied at the bedside and have treated it empirically because they were ignorant as to its nature. Investigators have devoted fruitless hours tracing into its ultimate analysis this mystery. Bacteriologists have discovered, rediscovered and disputed among themselves as to the organism responsible for all the mischief.

But when we are ready to despair, the discovery is made suddenly, and we are surprised to find how simple the explanation is.

Diphtheria is no longer a puzzle. It has been reserved for a contributor to the *Medical Record* to enlighten the profession and promise to practically annihiliate this "terror by night, this pestilence that walketh at noon-day." After a suitable introduction this investigator proceeds as follows:

To give myself a clear perspective, hence, I have determined to grasp the whole human being at the given moment—that is, to take everything into the scope of my investigation that might be a carrier of the cause of disease, as, for instance, the saliva, urine, the excrements, the vomita. the blood, and the membranes, of course all taken ante-mortem. I began under the mistaken idea that these researches could be concluded in four to five weeks, and that then I would be able to give myself and my interested friends a lucid explanation on their results. However, after I had once started on the inductive way and attempted to solve and answer the questions that suggested themselves, I saw before me a task which, for complication in respect to etiology, physiology, pathology, chemistry, and natural philosophy, left nothing to be desired. I stood before a seemingly endless problem. Periods of stagnation [cerebral?] occurred, but the more difficult the problem became the more energetically did I set my will to tear away the thick veil that nature in its mystery threw over it. My motto was: "I want to find the truth for the sake of the truth, even at the cost of my life."

There passed—shall I tell—five long weary years before I saw light, truth, and terra firma united before me. But this light shows me that I have placed myself in the most direct contradiction of to-day concerning microbes and bacteria as causes of disease. This contradiction I have not labored to find, neither did I desire it. It is here: it cannot be cast out from the world. We must calculate with this new factor, not in my interest, but in that of all humanity. I do not deny the existence of microbes or bacteria, but I do deny their causa primaria in the introduction of the disease. In twenty-five cases which I have systematically investigated I found microbes, bacilli, cocci, mycelia, thallophyta, spores, trichomata, palmelaceæ in various forms, but with these a heretofore unknown plus, which must not be omitted in this calculation. This unknown plus is composed of spirals, ova, granules, episperm. These factors form a constant basis in the disease, and hence they must be the real, and fundamental cause of diphtheria, while the hitherto supposed true causes are shown to be secondary phenomena.

On the results of my investigations I have constructed twelve theses. * * * The work is independent, unconstrained, uninfluenced by the current idea of the day. Here speaks Nature in her might, pure and unadulerated. The language of Nature is always truth, and this I wished only to interpret for my contemporaries and posterity in my work. I wished to present diphtheria, this dreadful destroyer of children, in persona ipsa, to the anxious mothers and to the profession.

THE THESES.—I. Diphtheria is caused by a living organism. This may be either winged or unfledged—infectio originalis.

II. The constituents of true diphtheria consist in spirals, ova, granules, episperm.

III. Tho granule is an albuminoid body and a toxicon katexochen. It is a trivalent, albuminoid animal ferment.

IV. The episperm is not a bacterium. It is the intrinsic, living attribute for the to-be-fructified ova. Its destination requires an exceedingly high degree of activity.

V. The so-called membrane is positively only a local manifestation of an eliminative and exudative process, caused by the previous absorption of granules into the blood and lymphatic circulation through the intestinal glands.

VI. The so-called membranes, whether creamy, chamois-like, hyaline, or parchment-like, are chemically and physiologically identical with the factors originally deposited in the intestines and partially their products of separation.

VII. The coexistence of microbes, bacilli, spores, schyzomyceta, mycelia, thallophyta, trichomata, palmelaceæ, and also other cryptogams and microbioses is not to be denied. They increase the intensity of the disease as well as the danger to life, but they are not the cause, neither the causa physica nor the causa excitans.

VIII. On the same basis of reasoning, there is a human and an animal diphtheria.

IX. The central and peripheral phenomena are dependent on the position of the constituents, but particularly on the condition, the quantity, and the translocation of the absorbed granules.

X. Diphtheria is an embryonal, intestinal parasitism, with consecutive local manifestations in the pharynx and larynx, with a decidedly cystic course, and of sometimes apparent hibernating tendency.

XI. The infectio originalis may occur directly or indirectly.

XII. An infectio secundaria is possible by means of the granule and episperm. It has, however, a decided moderation and deviation in its course.

These theses it is my intention to defend in my work against the representatives of bacteriology. For greater lucidity, I give below a short *resume* of my work on the nature of diphtheria. The causa physica, the punctum saliens of diphtheria is the generative propagation, or the succession of generation of a certain living organism. I am now in possession of this organism, of the spirals, ova, granules, episperm, membranes, etc. The *facit* of the entire inductive work leads to the conclusion that there are metamorphemena which select man, certain mammalia, and also birds as their host, to carry out the alimentation and transformation of their embryonal posterity in this adopted economy, although incidentally and and transitorily, yet also compulsorily.

The organism reaches the human economy by means of uncooked food, perhaps also in water in the form of a small insignificant larva, and here begins the progeneration in the production of ova.

After drawing a pathetic scene of the mother parasite sacrificing herself for her few thousand children—this mother, in anticipation of imminent death, carefully screwing by means of the spirals, the helpless young to the walls around them, dictating to the unwilling host the exact character of the food for each infant and providing for her children thousands of "episperm rods for fructification," and finally expiring of exhaustion—the author goes on.

The character of the disease, namely, whether there develops in a given case, diphtheria, scarlatinal diphtheria, or croup, is dependent on the disposition of the constituent elements, which form the natural modus propagandi. If, then, we wish to accurately specify the cause of diphtheria as such, we must say:

1. The propagation of the metamorphemena is the causa physica. 2. The mother, as the state of life, is the causa propria. 3. The spiral, as the chain between the intestine and the ova, is the causa mathematica. 4. The ova deriving fermented nourishment, the causa postulans. 5. The granule, as the general ferment, the causa excitans. 6. The episperm rods, as the fructifying element of the ova, the causa alterans. 7. The fruits of the creeper plants, as bearer of the germ, the causa medicatrix. 8. The sojourn of the being in the free nature, the causa remota.

The causa physica is chronologically in diphtheria as follows: 1. The albuminoid ferment, in breaking up the plasma, is the causa primaria. 2. The microbis, capable of multiplication only in an altered economy, is the causa secondaria. 3. All the microbioses, as bacilli, cocci, spores, mycelia, undoubtedly only the causa concomitans.

My work explains satisfactorily: 1. Where and why the membrane formation occurs in the pharynx and larynx. 2. How the membrane formation occurs, and of what it forms. 3. Why complications of bronchitis and pneumonitis appear. 4. When and under what conditions metamorphoses occur. 5. The metamorphoses may be: Diphtheritis pallida, diptheritis scarlatinosa, laryngitis membranosa, laryngitis membranosa crouposa, laryngo tracheitis membranosa.

After stumbling through this maze of polysyllables we are confronted by a cruel condition for he says:

That the metamorphemena follow this modus propagandi cannot be exclusively shown by medical investigation, for it lies in the province of the entomologists, whose competent decision of my correct or incorrect observation we must first obtain.

Entomologists owe it to themselves and to humanity to render this decision immediately. Refer the subject to the Bureau of Animal Industry of the Agricultural Department, which might spare time from investigating pork to settle this other parasite for the benefit of the nations. If they will do so the author promises:

On the discovery of this problem I will be able to place in the hands of medicine the proper and fitting key to a large group of intestinal diseases, as soon as the opportunity is given me for further researches.

Procul, O procul este profani.

Translations.*

MARIE B. WERNER, M. D.
PHILADELPHIA, PA.

James Israel in a dissertation on operations of malignant tumors of the kidney, states that if all published results of extirpation of the kidneys for malignant growths were grouped together, the resulting mortality rate—(50 to 61 per cent.)—show very discouraging figures. Some surgeons consider the operation, owing to these statistics, as improper. Israel has, however, arrived at the opposite conclusion based on his own favorable results. Among fifty-four operations on the kidney, he performed extirpation for malignancy eleven times with two deaths—eighteen per cent. Of the nine recovered; two died respectively six and thirteen months after operation from a metastasis; one of these, was a child of five years, in which the sarcoma filled the entireabdomen. The seven remaining cases have remained cured; in three cases five and a-half, four and two years have elapsed, in the remaining it is nine to two months since the operation.

Early diagnosis and improved technique will, in Israel's estimation, materially lower the mortality rate of these formidable operations.—*Deutsch. Med. Zeit., November 3, 1892.*

M. Von Strauch, (*St. Petersburg Med. Woch., 1892*) reports a case of myomectomie on the pregnant uterus in a patient, æt, 28, who gave a history of repeated attacks of peritonitis, and suffered later of dysmenorrhœa, which was cured by excisions of the vaginal portion of the uterus. She presented herself to Von Strauch during her fourth month of gestation, complaining of pain in the lower left half of the abdomen. An examination revealed a movable mass about the size of a goose-egg, situated to the left of the uterus. A diagnosis of subperitoneal fibroid of the uterus was made, in a month this doubled its size and ten days later showed signs of softening with increase of pain. An operation proved the mass to be a softening fibro-myoma attached by a short, but distinct, pedicle to the left cornus of the uterus. Recovery Complete.

A. Bür reports five interesting abdominal sections (*Deut. Med. Woch., 1892*): The first was an extirpation of tubercular mesenteric and retro-peritoneal glands. Recovery. The second invaginated bowel at ileo-cæcal junction—artificial anus. extirpation of the intussuscepted portion—enteroanastomosis—death. The fourth: through contraction of the mesentery numerous diverticulæ were formed which finally produced stenosis of the flexura sigmoidea—section—intestinal resection—artificial anus—death. The fifth a herniotomie which also included the vermiform appendix—recovery—*Centralb. f. Chirurg., April 4, 1892.*

Abstracts.

RADICAL TREATMENT OF HYDROCELE.

By THOMAS S. K. MORTON, M. D.

In an instructive paper the author presents the following conclusions:

1. Simple tapping, the injection of tincture of iodine or carbolic acid, and aseptic incision (with or without excision of a portion of the sac) are alone employed to any extent in the modern radical treatment of hydrocele.

2. Although other injection materials —notably bichloride of mercury solution and iodoform—have been commended, yet clinical proofs of their efficiency are lacking.

3. Simple tapping, under full antisepsis, may be relied upon to relieve any hydrocele and will cure a small percentage of cases.

4. The injection of moderate amounts of tincture of iodine (℥ j to ℥ iv) or carbolic acid (m.xx to ℥ j) will cure about 85 per cent. of the simplest forms of hydrocele. These two agents appear at present to stand almost upon an equality as regards percentage of cures and complications, but the acid has the advantanges of not giving rise to pain or shock and produces a much shorter period of disability; it appears also to be steadily gaining in popularity, and has cured many cases where the previous use of iodine has failed.

5. Cocaine should not be employed to prevent the pain incident to injecting

*Translated for the Medical and Surgical Reporter.

iodine, on account of its erratic and occasionally fatal constitutional effects.

6. The following conditions should prohibit any attempt at a radical cure by irritant injections:

a. Disease of the testicle or cord.

b. Hydrocele complicated by hernia or the presence of a hernial sac, or where there is any doubt as to the relations of the hydrocele sac.

c. The presence of multiple cysts.

d. Cloudiness of contained fluid.

e. Thickening or tuberculosis of the cyst walls.

f. Presence of considerable pain.

g. Presence of syphilis, tuberculosis or any depraved physical condition. Potassium iodide will cure most hydroceles of syphilitic origin.

h. Where communication with the abdominal cavity cannot be excluded.

i. The failure of previous attempts to cure in this manner.

j. Great size of cyst.

k. Extreme old age or where the cyst is developed in childhood.

7. A considerable time should be allowed to pass after reaccumulation of fluid following injection before undertaking other treatment, as the effusion is apt to be inflammatory and to disappear in time.

8. While many complications and even deaths resulting from attempted radical cure by the injection method are on record, yet most of these can be traced to violation of the above mentioned contraindications, to the employment of too large a quantity of the irritant, to the neglect of antisepsis, and to injecting into cellular tissue.

9. The method of tapping and injection is the method *par excellence* for those not familiar with the technique of surgery.

10. Permanent cure may be anticipated with almost absolute certainty, where the operation of incision and packing of the sac is performed. Failures under the Volkmann method can often be traced to:

a. Overlooking small secondary cysts or cartilage-like bodies, or failures to recognize disease of the testicle or cord.

b. Attempting to secure primary union.

c. Too early removal of the drain tube, where that method of drainage has been made use of.

d. Too small an incision.

11. The substitution of gauze packing for the drain tube in Volkmann's operation will probably prevent most of the complications that have been reported, and secure, with proper attention to minute secondary cysts, a uniformly radical and safe cure.

12. The death rate from simple incision and drainage is no greater than is that from injection of iodine. Sepsis and careless hemostasis are responsible for almost all complications and reported fatalities.

13. Excision of a portion of the sac—Bergmann's operation—is probably unnecessary and unjustifiable except where the tunic is exceedingly thickened or otherwise extensively diseased, as when containing calcareous patches or tubercular infiltration.

14. Incision of the sac may be performed under any of the conditions which contraindicate irritant injections except extreme youth, and certain constitutional conditions.

15. In double hydrocele both should never be injected at the same time, but double incision may be done when the local and general conditions are favorable.

16. A radical cure can only be promised when incision is employed.—*Philadelphia Polyclinic.*

ELASTIC CONSTRICTION AS A HÆMOSTATIC MEASURE.

By NICHOLAS SENN, M. D., Ph. D.

PROFESSOR OF PRACTICE OF SURGERY AND CLINICAL SURGERY, RUSH MEDICAL COLLEGE, CHICAGO.

Dangers Attending Elastic Compression of a Limb.—Compression of a limb by an elastic bandage, as a preliminary step to elastic constriction, secures for the tissues at the seat of injury or the field of operation perfect ischæmia, but is attended by two sources of danger:

1. When resorted to in the treatment of a recent injury or an infective inflammation, it might force pathogenic microbes from the wound or the seat of inflammation into the general circulation, thus adding a general to a local infection, with all the additional risks incident to such a condition.

2. In operations for malignant disease, carcinoma or sarcoma, it might force tumor-cells into the surrounding tissues, or through the lymphatic or blood vessels into the general circulation, causing thus

regional or general dissemination of the disease. These two sources of danger are not imaginary but real, and every surgeon with considerable experience can recall instances where elastic compression could be made answerable for the diffusion of an inflammatory process or the dissemination of a malignant tumor. Fortunately, Lister's experiments on the horse have demonstrated that, for all practical purposes, bloodless operations can be made without the use of the elastic bandage by simply placing the limb in a vertical position for a few minutes prior to the application of the constrictor.

Diminution of Blood-Supply to the Limb by Gravitation.—The influence of the force of gravitation on the supply of a limb becomes apparent by placing the arm in different positions. If one of the upper extremities is allowed to hang by the side of the body, and the muscles are fully relaxed, the veins become turgid, the capillaries distended, and the volume and force of the radial pulse markedly increased, and a sense of fullness and weight is experienced. If the arm is now elevated and held in the vertical position, within a few minutes the cyanosed appearance of the skin disappears and gives way to pallor, the overdistended veins collapse and are emptied of their contents, the radial pulse loses much of its volume and force, and the sense of weight and fullness is promptly relieved. If the limb is maintained in this position for five minutes, it is emptied of blood sufficiently to render operations, for all practical purposes, bloodless at any point below the elastic constriction. If an anæsthetic is used, elevation of the limb and the application of the elastic constrictor should not be done before the patient is thoroughly under the influence of the anæsthetic, as muscular relaxation is a material aid in securing a comparatively bloodless condition of the limb.

Form and Application of Constrictor.—Many surgeons have been in the habit of using a small solid rubber cord or a rubber tube of small size as an elastic tourniquet. Both of these forms of elastic constrictor are objectionable, as in either instance linear constriction is made, which particularly if the force employed be excessive as is so often the case, is so liable to cause temporary or permanent damage of some of the important tissues interposed between the skin and the underlying unyielding bone. The compression should include a ring at least two inches wide, in order to distribute the pressure over a larger area, in which event important structures are more likely to escape injury.

The best instrument for elastic constriction is a strong band of rubber at least an inch in width, of which at least two turns are applied side by side. In the absence of such a constrictor a soft rubber tube half an inch or more in diameter, an ordinary rubber bandage, or an elastic suspender should be used. As soon as the limb has been drained of its blood to the requisite extent by position, the constrictor is applied with sufficient firmness to interrupt at once both the arterial and the venous circulation. Simple as this advice may sound, it is nevertheless a fact that frequent mistakes are made in applying the constrictor properly. It is of the utmost importance that the pressure should first be made on the side of the limb occupied by the principal blood-vessels. If pressure is made first on the opposite side of the limb, the superficial veins are constricted first, and before the arterial circulation is interrupted, the limb presents a cyanotic appearance caused by an intense passive venous stasis. If, on the other hand, the elastic pressure is applied in such a manner as to arrest the principal arterial blood-supply first, venous return in the superficial veins is not interfered with until the circular constriction is completed, and the limb below the constriction is then in a comparatively bloodless condition, and remains so after the application of the constrictor. Some tact and experience are necessary in regulating the force required to interrupt quickly and completely the arterial and venous circulation. Less force is required, of course, when the main blood-vessels are near the surface and close to a bone than when a thick layer of muscles is interposed between skin and blood-vessels and the underlying bone. Pressure beyond the required degree, especially if continued for an hour or more, is liable to result in injury of muscles and nerves, and should be carefully avoided. Instead of using the chain or tying the constrictor in a knot, it is better after encircling the limb at least twice to cross the constrictor and fasten it between the blades of a

heavy hæmostatic forceps. A well-recognized disadvantage of elastic constriction as a hæmostatic measure is *increased parenchymatous hæmorrhage.*

The profuse capillary oozing which so often follows the removal of the elastic constrictor, is undoubtedly, at least in part, due to a temporary vaso-motor paresis caused by the constriction. This result is obviated most successfully by keeping the limb in an elevated position at the time the constrictor is removed, and by maintaining this position for at least six hours. The intravascular tension is reduced to a minimum by elevation of the limb, and this condition is most conducive to the formation of a minute thrombus in each of the small vessels—capillaries, arteries and veins--divided during the operation. Another exceedingly useful resource in diminishing unnecessary loss of blood, after all visible vessels have been ligated and the constrictor has been removed, consists in making firm pressure against the wounded surface. This is most effectually done by using a moist compress of gauze large enough to cover the whole surface, which is firmly held against the wound with one or both hands. After an amputation, for instance, all the principal vessels should be sought for and tied before the constrictor is removed, and the limb held in a vertical position. A compress of moist gauze is then placed against the wound surface, the flaps brought over it, and firm compression made over the end of the stump with both hands for at least five minutes. If the capillary oozing does not yield to this treatment, the wound should be irrigated with sterilized water at a temperature of 110° F., which makes a delicate white film on the surface, and has a very prompt effect in definitely arresting the bleeding. In obstinate cases the addition to these expedients of an application of peroxide of hydrogen serves an excellent hæmostatic purpose, and does not interfere with primary union of the wound.

Other complications arising directly from elastic constriction are:

Temporary Loss of Muscular Power, and Nerve Paralysis.—These consequences undoubtedly are often the direct outcome of a faulty use of the constrictor. The experiments made by me show conclusively that firm constriction, continued for several hours, almost invariably results in loss of function of the limb, which continues for several days or weeks. In these instances the disability was undoubtedly due to injury of the constricted muscles. If in the use of the constrictor more force is used than is necessary to interrupt the circulation, and particularly if linear pressure is made, injury of the muscles exposed to this undue pressure is very likely to be produced. The same can be said of injury to the nerves from the same cause. Two cases of nerve paralysis resulting from elastic contriction have occurred in my own practice.

For the purpose of preventing injurious pressure on nerves from elastic constriction, it is necessary to tie only with sufficient firmness to interrupt the arterial and venous circulation, and the pressure should not be linear, but distributed over a wide area, a ring at least one inch or two in width. The last requirement is best attained by using a wide band, or if an elastic tube or cord is used, the limb should be encircled several times, each turn drawn with uniform force and arranged in such a manner as to compress with equal firmness a wide circle, thus exerting the same effect on the tissues underneath as pressure made by a wide band. If for any reason the constriction cannot be made at a point where the principal nerves are well protected by a thick layer of muscular tissue, a thick compress of gauze ahould be placed between the constrictor and the limb, in order to protect the nerves against injurious pressure.

Necrobiosis and Gangrene Following Elastic Constriction. — Experimental research has shown that an ischæmic condition and elastic constriction, for two hours or more, are liable to produce an unfavorable influence on the karyokinetic processes in the tissues deprived of blood for this length of time. This is sufficient proof that prolonged constriction retards the healing process. Necrobiosis, slow healing, and necrosis of margins of the wound, are some of the remote consequences which follow prolonged constriction of a limb.

In the use of Esmarch's constrictor in arresting hæmorrhage that threatens life, it is practically not necessary to distinguish between venous arterial hæmorrhage. It was the consensus of opinion of the members of the military section of the last International Medical Congress in

Berlin, that it is no longer wise nor practical to differentiate between arterial and venous hæmorrhage, in rendering the first aid to the wounded on the battle-field, or in a case of accidental hæmorrhage; that the one point that must be taught the soldier, the brakeman, and the conductor, is that if hæmorrhage is so profuse as to threaten life before medical aid can be summoned, it should be at once arrested by elastic constriction,—by a suspender if nothing else is at hand,—applied invariably on the proximal side of the seat of injury. The constriction must be made with sufficient firmness to arrest completely both the arterial and venous circulation, as has been repeatedly insisted upon above. By applying the constrictor only with sufficient firmness to diminish the arterial circulation the venous hæmorrhage is increased. It is by overloading the tissues with venous blood by imperfect constriction that gangrene is invited and venous hæmorrhage increased.—*Internat. Medic. Magazine.*

BOOKS RECEIVED.

[In sending books for notice in the REPORTER, publishers are requested, for the information of the reader, as well as for their own advantage, to give the price. This announcement by title will be followed, in most cases, by a review, which will appear at the earliest opportunity.]

The Medical News Visiting-List, 1893: Thirty patients per week. Philadelphia: Lea Brothers & Co., 1892.

The Students' Quiz Series. Edited by Bern B. Gallaudet, M. D., Demonstrator of Surgery, College of Physicians and Surgeons, New York. Volume 13. *Diseases of Children.* By C. A. Rhodes, M. D., Instructor in Diseases of Children, New York Post-Graduate Medical School. Pocket size, 12mo., 170 pages. Limp Cloth: $1.00. Philadelphia: Lea Brothers & Co., 1892.

Anatomy (Double number): By Fred J. Brockway, M. D., Ass't. Demonstrator of Anatomy, College of Physicians and Surgeons, New York; and A. O'Malley, M. D., Instructor in Surgery, New York Polyclinic. Philadelphia: Lea Brothers & Co. Price $1.75.

Histology, Pathology and Bacteriology: By Bennett S. Beach, M. D., Lecturer on Histology, Pathology and Bacteriology, New York Polyclinic. Philadelphia: Lea Brothers & Co. Price $1.00

Text-Book of Nervous Diseases; Being a compendium for the use of Students and Practitioners of Medicine: By Charles L. Dana, A. M., M. D., Professor of Nervous and Mental Diseases in the New York Post-Graduate Medical School, etc.; with two hundred illustrations. New York: William Wood & Co., 1892.

Consumption and Kochine (Tuberculosis Kochii), II (August, 1892).

Original Observations and Reports Based on Individual Experience: By Dr. Rudolf Seiffert, Graduate of the Universities of Vienna and Heidelburg, etc. Authorized translation by Wolf Von Schurward, Chicago. Ackermann & Eyller, 86 Fifth Ave. Price $1.25.

The Physician's Leisure Library. Geo. S. Davis, Publisher. Issued monthly. Price 25 cents.

Fissure of the Anus and Fistula in Ano: By Dr. Lewis H. Adler, Jr.

Acne and Alopecia: By L. Duncan Bulkley, M. D.

Diseases of the Chest, Throat, and Nasal Cavities, including Physical Diagnosis and Diseases of the Lungs, Heart, and Aorta, Laryngology and Diseases of the Pharynx, Larynx, Nose, Thyroid Gland, and Œsophagus. By E. Fletcher Ingals, A. M., M. D., Professor of Laryngology and Practice of Medicine, Rush Medical College. Professor of Diseases of the Throat and Chest, Northwestern University Woman's Medical School; Professor of Laryngology and Rhinology, Chicago Polyclinic, etc., etc. Second edition, revised and enlarged. 240 illustrations. Octavo, 700 pages, extra muslin, price, $5.00. William Wood and Company, New York.

THERAPEUTICS.

In response to inquiries concerning drugs recently introduced the values of which are yet *sub judice,* THE REPORTER presents, in the following notes, the latest available information:

LOSOPHAN.

Saalfield (*Therap. Monatsh.*, October, 1892) describes the use of losophan (triiodocresol) in skin diseases. He has found it of special value in parasitic affections of the skin, both vegetable and animal. In sixteen cases of tinea tonsurans of the face and body, thirteen were cured and three much improved, and in three cases affecting the scalp, one was cured and the others much improved. In some cases of parasitic sycosis, good effects were obtained, but when necessary, epilation was also had recourse to. It was used in a one or two per cent. spirit and water solution. In pityriasis versicolor an ointment (one to two per cent.) gave good results, and in cases of pediculi capitis and pubis, a one per cent. solution was useful. Scabies, however, seemed to improve more rapidly under the more usual methods of treatment. In some cases of prurigo, chronic eczema with infiltration, sycosis vulgaris and acne vulgaris, and rosacea, this treatment was efficient. In psoriasis and primary syphilitic affections it was of little service as an anodyne application. As a drying powder (one per cent.) for wounds, it had but slight effect. It is contra-indicated in any acute skin disease owing to its irritant properties even in dilute solutions.—*Br. Med. Jour.*, Nov. 5th, 1892.

EUROPHEN.

Among the new surgical dressings europhen seems to have quietly taken an elevated position as a positive and complete

substitute for iodoform. It seems probable from recent investigations that we must rely upon some form or combination of iodine in order to secure a perfect, local antisepsis. The reports tend to coincide as to two or three very considerable advantages possessed by europhen. The chief of these lies in the fact that the iodine component of europhen is given off slowly, thus presenting fresh, or nascent, iodine to the tissues, and maintaining the healing processes. A further advantage in this slow development of iodine is, that it prevents the possibility of irritant or toxic action. This is why large denuded surfaces, like burns or scalds, may be fully covered with it, and not give rise to any untoward effect. Europhen, in fact, appears to be especially adapted to extensive lesions, since its coverning power is five times greater than that of iodoform, while its odor, though faint, is sufficiently well characterized to neutralize the peculiarly disagreeable fragrance attached to all surgical dressings. We note that recent clinical articles in approval of europhen in the dermatosis, traumatisms and ulcerations, as also in specific lesions have been written by Drs. Allen, Chappell, Shoemaker, Giles, Fernandez, Gilbert, Eichler and many others, who have extended the uses of europhen to ophthalomology, gynecology and rhinology as well as the needs of minor and general surgery.—*Ex.*

THE LOCAL USE OF PHENACETINE.

In a communication to the Tennessee State Medical Society. Dr. M. H. Lee, of Knoxville, presents the results of some very clinical tests made by him in the topical employment of phenacetine. Dr. Lee says: "Phenacetine has been largely and successfully used in hemicrania, rheumatism, neurasthenia, agina pectoris, and locomotor ataxia. Still, we claim a no less important office for this drug, and this is, its local application to ulcers." The writer then enumerates a large number of remedies he had tried in ulcerative conditions without obtaining satisfactory results. Finally at the suggestion of Dr. C. B. Lee, he tried finely powdered phenacetine, which was dusted over the ulcerations three times daily. "The effect," says Dr. M. H. Lee [the writer of the report], "was remarkable, and dated from the first application of phenacetine."

The first case presented, is that of a woman, æt. fifty, who, for five years, had had a syphilitic ulceration of the foot and leg. Anti-syphilitic treatment had been employed in conjunction with the usual topical remedies, without a satisfactory result. The internal treatment was continued and phenacetine applied locally. "The ulcers," says the writer, "began healing rapidly, while the pain vanished as by magic."

Case II. The ulceration had followed a severe injury to the hand, made with a saw. Bichloride gauze and iodoform had, unsuccessfully, been tried. Phenacetine was then employed, and, says the report, "the change for the better was noticeable at once; one week later the patient went to work."

Case III. Refers to a young man suffering from pyemia following a severe incised wound of the arm and hand. Various alteratives and antiseptics were used internally and externally without result. "Pulverized phenacetine was now used locally, with the same internal treatment [iron, quinine and strychina], from which time the improvement was rapid until the wounds healed."

Case IV. The patient, sixty years of age, had suffered for forty years from a chronic, indolent, syphilitic ulceration of the foot and leg. No treatment had proved effectual, and Dr. Lee found the patient suffering from uremia, incontinence of urine and an irritated skin, besides being delirious. "These symptoms," says the writer, "were treated on general principles, except the ulcer, which was dressed daily with phenacetine, and this cleaned out the dead tissue and caused healthy granulations to appear at once."

THERAPEUSIS OF PIPERAZIN.

Accepting the very clear and complete clinical researches of Biesenthal, Schweninger, Ebstein, Vogt, Gautrelot, Heubach, Bardet, and all other well known physicians, general practitioners have made many interesting tests of piperazin and have arrived at some very satisfactory conclusions concerning its value. Its chief therapeutic indication is the uric acid diathesis, or the dyscrasia resulting from that condition. It is, unquestionably, the most energetic solvent of uric acid, and uratic concrementa which may be employed with the human organism without producing toxic effects. With uric acid

it forms a neutral, soluble combination, while, at the same time, it dissolves the various albuminoids and their homologues. Prescribed in combination with phenacetine it has very marked influence upon the gouty condition and promotes the absorption of undesirable exudates. The value of piperazin in both acute and chronic gout, appears to be very decided. Schweninger reports success in ninety-two per cent. of his cases, and states that he could get no such results with any other remedy. Biesenthal also administered piperazin in gout, in renal colic, and in urinary hæmorrhage with perfect success. He gave it in carbonic acid water 1 to 500. The ordinary daily dose of piperazin is fifteen grains. Some clinicians begin with three grains per diam, or one grain doses t. i. d.

TRIONAL.

Boettiger [*Berl. Woch.*, October 17th, 1892] has used Trional in seventy-five cases in Professor Hitzig's clinic. The single evening dose is from one to two gms. [one to two gms. was mostly used]. It was occasionally given in divided doses during the day. Any systematic treatment was not interrupted. The cases fall into three groups: [1] Simple sleeplessness occurring in functional or organic nervous disease. Uninterrupted and mostly deep sleep occurred in from fifteen to forty-five minutes. In only one case was any giddiness or other ill effect noted on the following day. In some cases the drug was used every evening for two or three weeks without losing its effect. [2] Sleeplessness with bodily pain. Here the results were not nearly so good. In one case referred to of severe hypochondriasis, the result was variable according as there was pain. As regards morphine and cocaine habits, the author, unlike Schafer [Epitome, August 20th, 1892, par., 166] found it useful in one case. (3] The third group, including patients with mental disease, is divided into two parts according as the sleeplessness was accompanied by moderate or severe mental excitement, etc. In only two of twenty-two cases of the former class was there no hypnotic action. The drug had no effect on the mental condition. In the second class the results were variable. Whether larger doses would have been more efficient is doubtful; unpleasant results have been noted after such larger doses. The author refers to five cases of mental disease with marked excitement, in which fractional doses were given with the best results, but he adds that the number of the cases was too small. The drug was given by the rectum, usually in two g. doses, in sixteen cases. It acted as promptly and effectively as when given by the mouth. The drug is without effect in sleeplessness due to bodily pain, in acute alcoholism and in cases of great mental excitement and motor restlessness. Trional has a more marked and prompt action than chloralamide, two g. of the former corresponding to three or four g. of the latter. Amylenhydrate approaches nearer to Trional in its effects. In some cases Trional may take the place of hyoscine, yet the subcutaneous injection of the latter is preferable in great mental excitement.—*Ex.*

SALOPHEN.

CAN WE ADMINISTER THE REMEDY? At this season of the year we get our most refractory cases of rheumatism, and the old questions arise: Can we increase the doses of our remedy? Will the gastric, nephritic or cardiac functions of our patients permit a further use of the medicaments in which danger, discomfort, or perhaps failure are involved? In reviewing the combinations of salicylic acid with various bases, and especially with the phenols, the physician feels that he has here several weapons of requisite power provided the patient can withstand their use. The personal equation is the cause of trouble, and it cannot be ignored. These causes seem to have induced many able practitioners to promptly test a new remedy—paramiodosalol—which, under the name of Salophen, makes exceptionally high claims as a safe and effective medicament in acute rheumatism. In the *N. Y. Med. Jour.*, July 30th, 1892, Dr. Wm. H. Flint presents a series of cases in which he has tested Salophen for the condition cited. His conclusions are clearly and decidedly given, as follows:

"No relapses occurred and no complicating endocarditis, pericarditis, or pleuritis appeared. From these facts the writer concludes that we possess in Salophen a remedy equally potent as the other salicylates to control the symptoms of acute rheumatic arthritis, but devoid of their tendency to weaken the heart's action, to disturb the stomach, and to produce albu-

minuria and smoky urine."

Salophen was administered in doses of fifteen grains every three hours, or thrice daily, with ten-grain doses of bicarbonate of soda given at the same time. Dr. Flint's conclusions are amply confirmed by those of Frölich [Vienna] who states [*Wein. Med. Woch.*, Nos. 25, 6, 7, 8, 1892] that "Salophen has shown itself a prompt and rapidly acting remedy against acute rheumatism," and that "It may be administered, even in large doses, for a long time, without the disagreeable after-effects of other salicylic or phenolic preparations." Gutmann, Siebel, Goldmann and others testify also, to constantly successful results from the exhibition of Salophen in arthritic conditions, and it is not improbable that the employment of this new derivative will not, in private practice, be attended with the professional anxiety inseparable from the treatment of rheumatism with more or less toxic compounds.

PHENOCOLL IN THE TREATMENT OF MALARIA.

Phenocoll, a derivative of phenacetine, has been tried by P. Albertoni (*La Riforma Medica*, February 5, 1892; *Revue de Thérapeutique Générale et Thermale*, June, 5, 1892) in thirty-four cases of malaria. A permanent cure was obtained in twenty-four; in five the results were doubtful; and in the other five the drug failed to do any good. Some of the patients cured by phenocoll had suffered severe relapses after treatment with quinine. Phenocoll was given, in form of powder, in doses of fifteen grains (one gramme), six or seven hours before the expected paroxysm, and after the disappearance of the paroxysms, to prevent relapses, the medicament was continued for some time after. The new remedy has no unpleasant after-effects, and the taste is easily disguised by mixing it with sugar. In this manner children take it readily.—*Univ. Med. Mag.*, Sept., 1892.

THIOL IN INFANTILE THERAPEUTICS.

Dr. Moncorvo has employed this new antiseptic agent in more than one hundred infantile cases for the purpose of diminishing suppuration and for the removal of cutaneous growths, either of parasitic origin (tinea tonsurans, favus, pityriasis, etc.) or dependent upon general dyscrasiæ (tuberculosis, syphilis, etc.). Thiol may be used with equal efficiency in the dry form (thiol powder), pure or rubbed up in vaselin (five to ten per cent.), or in liquid form, pure or diluted with boiled sterilized water.

The topical use of thiol was never followed by the least untoward local or general effect. The therapeutical effect was satisfactory in every case. It was used, without fear of danger, on the youngest children. (The author has used thiol in treatment of erysipelas and lymphangitis in adults with the greatest success.—*The Satellite.*

Dr. Montague Gunning used a solution of chloralamid with potassium bromide in two cases of sea-sickness with most satisfactory results. The first case was that of a gentleman who previously had never suffered from the affection. After the vessel had left land about three hours he began retching and continued doing so for three hours. Dr. Gunning then prescribed the chloralamid solution, which gave immediate relief, bringing on refreshing sleep from which the patient awakened practically recovered. The other victim was a lady who had suffered for hours, but who slept for an hour after one dose of the remedy and was not again troubled with sea-sickness. The author was so favorably impressed with the action of the remedy that he hastened to call attention to it in the *British Medical Journal.* There is now a good quantity of evidence of this kind.

An interesting contribution to our knowledge of the therapeutics of phenocoll and piperazine comes from South Africa. Dr. J. O. Ungerhausen, District Surgeon of the Lion's River Division, writing from Houick, reports the very satisfactory results yielded by phenocoll hydrochloride in various cases of influenza and ordinary cold, when the mucous membrane of the upper respiratory passages was swollen and inflamed. The cold developed more rapidly and ran a milder course, headache being removed. A beneficial influence was also observed on the bodily temperature in several cases of diphtheria, when it was prescribed in combination with benzoate of soda. The same observer used phenocoll and piperazine in a few cases of gout; the results were unexpectedly suc-

cessful, so that Dr. Ungerhausen expresses the opinion that this combination is more effective than any remedy hitherto proposed.—*Ex.*

THIOL: ANTISEPTIC REDUCING AGENT.

Thiol is a synthetical product recently introduced, which closely resembles ichthyol, both in its chemical composition and therapeutic properties, but is free from some of the objectionable features of the latter. It has not the unpleasant odor of ichthyol and does not stain linen; it is also free from irritant effect which ichthyol often manifests. The usual form is a dark liquid, containing forty per cent. of the base; but it can be obtained pure in scales or powder.

Being regarded as a purified ichthyol, it has been used in all the affections in which ichthyol has been found beneficial, and as rule, with equally good if not better results. Prof. Schweninger, after a thorough trial of the remedy in his clinic in Berlin, regards it as superior to ichthyol.

It has marked effects in causing the absorption of pelvic exudates. Large inflammatory masses and adhesions may be often removed in a few weeks. It is well applied on tampons in five per cent. solution in glycerin, renewed every second or third day, and it is well to administer it internally at the same time. Erosions of the cervix are also very promptly healed by this treatment. Used as it occasionally is, in very strong solution, fifty per cent. or over, it acts much as tincture of iodine, causing a sensation of burning, with loss of the epithelium. In endometritis, which resists the usual modes of treatment, a speedy cure is often effected by applications of pure thiol made weekly.

While recommended in many skin diseases, there is one affection in which this remedy acts remarkably well, and that is in facial erysipelas. Used with lanoline in the strength of fifteen to twenty-five per cent., it will effect a cure often in two days, and rarely has to be used over four or five. This ointments should be spread on cloths and kept constantly applied.

In burns, frost-bites and chilblains a ten to twenty per cent. thiol-lanoline ointment is an effective application. For external applications the dry powder is often used, being incorporated with oxide of zinc or with bismuth, in the proportion of five to ten per cent.—WASHINGTON DODGE, M. D., in *Pacific Med. Journal.*

SURGERY.

BRAIN ABSCESS RESULTING FROM SUPPURATIVE OTITIS MEDIA.

A patient, æt. 30, had suffered for a number of years with middle ear inflammation on both sides. During a few days he had also had intense pain on the right side. There was great tenderness over the right mastoid and parietal bone, and paralysis of the right facial nerve. For a few days there had been disturbance of the sensorium, hemiplegia and hemianæsthesia on the left side, muscular twitching in right arm and leg. Opening the mastoid temporarily improved the symptoms. Soon after, external strabismus of the right eye appeared. Trephination was, therefore, made at the right of the second temporal convolution. The dura mater was injected, and greatly pressed forward. An incision into the brain gave exit to soft, degenerated brain substance and sero-purulent fluid. No distinct cavity or pus-sac was found. Death followed in eight days. The autopsy revealed extensive necrosis of the right mastoid process, with corresponding circumscribed pachymeningitis, with softening of the whole right cerebral hemisphere, hemorrhage into temporal convolutions, and secondary meningitis.—*Centralblatt f. klin. Medecin*, 1892.

THE STRAIGHT TUBE THE SIMPLEST CATHETER.

Ziegenspeck (*Centralblatt für Gynakologie,* 1892), states that Wolfner recommends a simple straight tube for the female bladder. His reasons are:

1. The conical end is more easily arrested in folds of the mucous membrane and leads to false passages.

2. The catheter with side opening is more difficult to disinfect.

3. The catheter with the blind ends and side openings has a lost space which it compels us to insert and prevents the walls of the bladder lying upon one another, when it is emptied; also the lost space conveys air into the bladder.

4. By swelling of the mucous membrane, or spasm of the muscular coats, the mucous membrane is pressed into the eye of the catheter making its withdrawal difcult.

5. Foreign bodies, as sand, mucus.

etc., pass with more difficulty through the indirect passage afforded by the opening on the side.

Kustner, in 1890, suggested glass as the best material for the tube. His catheters measured 10 cm. and were cut obliquely on one end.

Ziegenspeck recommends the Kustner instrument which possesses all the advantages of Wolfner's and is easier to clean. The obliquely cut end affords a larger opening, and consequently easier emptying of foreign masses. In healthy bladders he does not advise the use of obliquely cut tubes. He thinks a slight curve to Kustner's glass tube would facilitate its passage in some cases, and would not interfere with the ease of cleansing it. Glass, he thinks is the best material for these tubes, as it can be easily bent, its transparency enables any uncleanliness of the instrument to be detected, and it can be sterilized by heat.

In washing out the bladder, a rubber tube is attached to the outer end, by which the nozzle of a syringe may be connected, the bladder filled and the fluid allowed to run out. The advantages of this over the double current catheter consists in the fact that the bladder is stimulated to contract, whereby the antiseptic solution finds its way deeper in the tissues; that air-bubbles are not passed into the bladder along with the injecting fluid; its simplicity and cheapness; the readiness with which it can be improvised.

In washing out the female bladder, at times he introduces the glass tube while the injecting fluid is streaming through. The fluid returns along the side of the catheter. His method of preparing his catheters consists in cutting glass tubing in pieces 10 to 12 cm. long, and melting the cut ends in the flame of a spirit-lamp until well rounded.

OBSTETRICS.

THE VALUE OF ANÆSTHETICS IN OBSTETRICS

Dr. A. Düherssen (*Berliner Klinische Wochenschrift*, No. 15, 1892), calls attention to the many cases in which anæsthesia is of service in obstetrics. He fears that while specialists are perfectly accustomed to its use, too many physicians make little or no use of it. Doubtless, in some cases, this is because there is no other physician at hand to administer the anæsthetic. When he has occasion to perform an obstetrical operation, and is alone with the midwife, he himself prepares the patient for the operation, placing her in the proper position; then he disinfects himself, then the patient, and after this devotes himself entirely to administering the anæsthetic. As soon as the anæsthesia is complete, he brushes off his hands once more with the disinfecting solution, and proceeds to the operation himself.

Obstetrical operations are usually brief, so that one deep anæsthesia is usually enough to allow their completion. When this is not the case, the nurse may be directed, in case the patient awakes, to put one or two drops of chloroform upon a thin cloth mask, which lies over the patient's mouth. When managed in this way, he thinks there is no blame attaching to the physician should a bad result follow. The severe asphyxia occurs chiefly in the beginning of anæsthesia, later only when unreasonably large quantities of chloroform are applied. A man is protected from these asphyxias, or against the blame for them, when he devotes himself at first exclusively to administering the anæsthetic, and becomes, to a certain degree, simply the chloroformer.

Anæsthesia is very valuable for the patient, since it spares her pain. If she is suffering very much and tossing about, it may be impossible for the physician to make a complete diagnosis without producing anæsthesia. He then can ascertain if the infantile pulse is normal. The mother's pulse while narcosis lasts is also important; if it remains above 100, it is a sign something is wrong.

The internal examinations are vastly easier to make, and thus the physician is promptly able to make choice of the most suitable obstetrical operation. If it is a sensitive, first confinement, it may, on account of tense perineum, be difficult to reach high enough into the pelvis. If, in such a case, there also exists a considerable swelling of the head, which may reach clear down to the vulva, the physician is easily led to believe that the head is already well down in the pelvis, and that an extraction with forceps will be easily possible. In fact, the head may still be above the entrance to the pelvis, and the use of forceps would be difficult or impossible; in such a case, turning might be

possible later. When an anæsthetic is used, such errors are prevented, for the pelvis can then be thoroughly explored.

It is also very important to produce anæsthesia, in order to make correct diagnosis of abnormal presentations; especially is this the case when there is a posterior parietal presentation, or a deep transverse presentation; and it is valuable in all cases where the part presented is still high and we cannot make an exact diagnosis with one or two fingers, but need to introduce the whole hand,

The same is also true of the cases where some malformation, abnormally large head, etc., are met; also where no part is presented, or the presenting part is still high above the pelvis.

In the second place, anæsthesia is of valuable assistance in obstetrics in all those cases where turning needs to be assisted by the outer hand. Among these cases belong turning, and especially the combined turning of the child, the loosening of the placenta, and the presence of tumors; and when the os uteri is sufficiently dilated.

In the third place, anæsthesia has a very great value as a direct therapeutic agent, and that, too, used very superficially, in hastening the delivery, as in cases where the pains, although very great, do not accomplish much, and where the uterus does not relax properly in the pauses.

The production of anæsthesia is contra-indicated in cases of sepsis, or should at most be very cautiously undertaken, for so-called chloroform death has been seen in cases of sepsis. Chloroform death may follow an abortion at the very first breath of chloroform.

Deep and long-continued anæsthesia is contra-indicated in cases of eclampsia. The narcosis is very valuable in eclampsia, but only in order to permit an obstetrical operation; the earlier this is performed the better, as eclampsia affects the heart-muscle.

Narcosis is contra-indicated in cases of tetanus uteri, and where there is weakness of the heart.—*Therapeutic Gazette.*

MEDICINE.

BUFFALO LITHIA WATER IN THE TREATMENT OF RENAL CALCULI.

Albert Goodwin, of Eufaula Ala,., states that for a number of years he has prescribed Buffalo lithia water, with uniformly efficacious results, in gout, rheumatic gout, rheumatism, and all diseases of a uric-acid diathesis, and its extraordinary therapeutic value prompts him to report the following cases of renal calculi dependent upon a uric-acid diathesis relieved by its use after the failure of other approved treatment:

J. N. L., a cotton merchant, between forty-five and fifty years of age, was subject for six or seven years to frequent attacks of nephritic colic, and almost invariably passed a calculus after each paroxysm. The paroxysms finally became so freqneut that the colic was almost constantly present, rendering his existence miserable. Of necessity, resort was had to opium and other anodynes, with a view to mitigating his intense suffering, until he became a confirmed victim of the morphine habit. His nervous system was shattered, and he was indeed a mere wreck. In this condition, by Dr. Goodwin's advice, he visited the Buffalo Lithia Springs, Virginia. For several months previous there had been a continuous pain in the kidney, caused, as Dr. Goodwin thought, by retained calculi or incrustations in the pelvis of the kidney.

After a few weeks' use of the water of spring No. 2 the beneficial results were very marked, the paroxysms became less frequent and of less severity, and there commenced a free discharge of calculi and sand, which continued for some three weeks, gradually diminishing and finally ceasing altogether. This was followed by rapid improvement in his general condition, and some weeks afterward he retnrned home in full and vigorous health, having gained while at the springs forty pounds in weight. By the continued use of the water after returning to his home he was enabled to overcome the morphine habit entirely and lived some years, having no return of his old disease.

This water proved not less efficacious in a similiar case in Dr. Goodwin's own person. In October, 1890, he was attacked with nephritic colic of the severest type. Within a period of seven or eight weeks he had fifteen to twenty paroxysms, none of them lasting less than two hours, and most of them from six to fourteen. The free and continued use of Buffalo lithia water resulted in a total cessation of the attacks and the restoration of his genera

health, which had been much impaired. There has been no return of the attacks up to this date—August 15, 1892. He has prescribed this water in other similar cases with decidedly beneficial results, and has no equal among the medicines or mineral waters of which he has any knowledge. It is especially adapted, he says, to cases in men who are broken down by the long and continued use of alcohol and opium in their various forms.—*N. Y. Med. Jour.*

NASAL CATARRH.

Dr. Louis Jurist, Chief Assistant in the Laryngological Department at Jefferson Medical College, in lecturing on "Diseases of the Upper Air Passages" said that all those suffering from dyspepsia will have more or less disease of the upper air passages, and in order to effect a cure of the nasal or throat trouble the digestive tract must be treated, and very frequently the patient will be cured without any special treatment for the throat or nose. The doctor who depends entirely on local treatment of nasal affections will surely fail to cure the trouble. He called attention to the fact that women suffering with chronic uterine troubles very frequently will have some nasal affection. The first element in the treatment of nasal catarrh is cleanliness, and this is most important. This is best maintained by the use of an alkaline wash or spray. For the removal of odor any one of the following may be used: solutions of permanganate of potassium, boric acid, salicylic acid, creolin, or peroxide of hydrogen.—*College and Clin. Record.*

NEWS AND MISCELLANY.

THE S. D. GROSS PROFESSORSHIP OF PATHOLOGICAL ANATOMY FUND.

The committee appointed by the General Committee to audit the account of Dr. Richard J. Dunglison, Treasurer of the S. D. Gross Professorship Fund of the Alumni Association of Jefferson Medical College, respectfully report that after an examination of such account they find that there were sixty contributors to the fund, the total amount contributed being $3,499.10. In accordance with a resolution of the General Committee these contributions have all been returned to the donors, and the treasurer has presented a voucher for each amount thus refunded. A great portion of the whole amount has been retained undistributed until recently, so that the interest on the amount might so accumulate as to enable the committee to refund to each subscriber the full amount of his contribution, without any deduction for expenses of publication of circulars, postage, etc., which were necessarily heavy, from the widespread diffusion given the objects of the fund.

The names and addresses of the subscribers and the amounts contributed by them are as follows:

Dr. S. W. Gross, Philada., Pa.	1,000 00

THE SAMUEL D. GROSS PRIZE.

The first Quinquennial Prize of One Thousand Dollars under the will of the late Samuel D. Gross, M. D., will be awarded in 1893.

The conditions annexed by the testators are that the prize "Shall be awarded every five years to the writer of the best original essay, not exceeding one hundred and fifty printed pages, octavo, in length, illustrative of some subject in Surgical Pathology or Surgical Practice, founded upon original investigations, the candidates for the prize to be American citizens."

It is expressly stipulated that the successful competitor shall publish his essay in book form, and that he shall deposit one copy of the work in the Samuel D. Gross Library of Philadelphia Academy of Surgery.

The essays, which must be written in the English language, should be sent to Dr. J. Ewing Mears, 1429 Walnut St., Philadelphia, before June 1, 1893.

Each essay must be distinguished by a motto, and accompanied by a sealed envelope bearing the same motto, and containing the name and address of the writer. No envelope will be opened except that which accompanies the successful essay.

The Committee will return the unsuccessful essays if reclaimed by their respective writers, or their agents, within one year.

The Committee reserves the right to make no award if the essays submitted are not considered worthy of the prize.

INCESSANT HICCOUGH.

Reading in the daily press lately several accounts of a most persistent case of hiccough, which had lasted many days, and which was baffling the skill of the local medical fraternity, recalls to my mind a case of the same trouble which came under my care while a resident physician in Cook County Hospital, Chicago, of which case I find I have complete notes:

S. S., a Russian peddler, aged twenty-seven, admitted to the hospital, April 30, 1888. Had always been in good health; on admission complained only of a persistent and incessant hiccough, which continued night and day; it had already lasted one week; he was thoroughly exhausted from loss of sleep and the pain and soreness produced by the contractions of the diaphragm; the usual remedies for these cases, such as morphine, bromide and chloral, ether, cannabis indica, bismuth, soda and atropine, were each tried, but with little or no effect; morphine in large doses would relieve for one or two hours and allow the patient some sleep; electricity applied to the epigastrium and to the phrenic nerve was of no avail.

On examination over the region of the stomach, that organ was found to be considerably dilated and to contain a large quantity of fluid; there was no external signs of a pyloric obstruction; thinking that the dilation of the stomach and the retention of fermenting food might be a cause of the hiccough, I introduced a siphon-tube into the stomach and thoroughly washed out that organ; at least two quarts more of fluid were removed than had been introduced through the tube, and that which was removed was in a high state of fermentation. After this operation the hiccough entirely ceased, and the patient had his first good night's sleep in sixteen days. He was discharged two days later, with no return of the trouble.—*Col. Med. Journal.*

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY FROM NOVEMBER 20, 1892, TO NOVEMBER 26, 1892.

Leave of absence for one month is granted First Lieutenant James D. Glenna, Assistant Surgeon of Army.

Leave of absence for one month, on surgeon's certificate of disability, with permission to leave the limits of the department, is granted Major John C. G. Happersett, Surgeon of Army.

A board of officers, to consist of:—Colonel Joseph R. Smith, Assistant Surgeon General, of Army; Major David S. Huntington, Surgeon of Army; Major Benjamin F. Pope, Surgeon of Army, by direction of the President, appointed to meet at Whipple Barracks, Arizona, on Monday, November 28, 1892; or as soon thereafter as practicable, for the examination of Captain Louis M. Maus, Assistant Surgeon, with a view to determining his fitness for promotion, as contemplated by the Act of Congress, approved October 1, 1890.

Leave of absence for one month with permission to apply for an extension of three months is granted Captain S. W. Crampton, Assistant Surgeon of Army.

First Lieutenant, George J. Newgarden, Assistant Surgeon, (recently appointed) is assigned to duty at Fort Sheridan, Illinois.

First Lieutenant, Charles F. Kieffer, Assistant Surgeon, is relieved from duty at Fort Sheridan, Illinois, and assigned to duty at Fort Meade, South Dakota.

THE BEST FRENCH TONIC

Vin de Bugeaud

A TONIC AND NUTRITIVE WINE WITH CINCHONA AND COCOA

VIN DE BUGEAUD is prepared with the greatest care, with active substances of the very best quality, and chiefly with wild Bolivian Cinchona, the cultivated species being strictly discarded, and the proportions being precisely in accordance with the French pharmacopœa.

It is perfectly tolerated by the most delicate stomachs, owing to the emollient action of the Cocoa it contains, which favourably corrects the over exciting properties and the bitter taste of the Cinchona.

In preparing it, a full-bodied Spanish wine is employed, this wine being more than any other capable of dissolving the medicinal ingredients.

VIN DE BUGEAUD commends itself to the medical profession oth by its tonic and antiperiodic properties, and by the certainty nd continuity of its action in cases of

Anæmia, Chlorosis, Intermittent Fever, Chronic Diarrhœa, Gastralgia, Convalescences,

in a word to combat

Constitutional or Accidental Debility

no matter from what cause arising.

It is specially suitable for convalescents, debilitated children, delicate women and old persons enfeebled by age and infirmities.

VIN DE BUGEAUD has enjoyed since 1858 the high approbation of the New-York Academy of Medicine. Thousands of practitioners of all countries have spontaneously borne testimony to its efficacy.

Professionnal gentlemen are invited to apply for a copy of the pamphlet (sent free on demand) which contains, along with a few remarks on **VIN DE BUGEAUD** and the opinions of the French medical press on the subject, a number of the most recent testimonials.

VIN DE BUGEAUD may be obtained of all good Chemists and Druggists.

A CONTRIBUTION ON PATHI-FRACTURE AND LESIONS OF THE SOFT PARTS, WHICH INVOLVE THE ANKLE-JOINT.*

By THOMAS H. MANLY, M. D.
NEW YORK.

Physical violence is frequently a cause of moderate or serious injury to the anatomical structures which compose the ankle-joint. There are few who have reached, or passed middle-life that have not, some time, in varying degree, so wrenched this articulation that they have, for a varying period of time, experienced more or less temporary inconvenience. Besides these trifling, unimportant cases, there is a large number of a more grave and serious character; of a simple or a mixed nature, which may involve alone or conjointly the osseous or arthritic elements.

The ankle-joint, though subjected to the greatest strains, and the most exposed in the body, manifests, in a singular degree, the power of resisting inflammation, and is seldom permanently anchylosed, as a consequence of vulnerating force. Although classified by anatomists as ginglymus, nevertheless motion well-marked, though of a limited range, is permitted in the direction of abduction, adduction and rotation. The head of the astragalus is the fulcrum for the leverage and action of the distal end of the tiba. The function of the fibula is mainly to steady and support the ankle. This joint is supported and powerfully acted on, by four sets of tendons, which cross it anteriorly, posteriorly, laterally, the two former in locomotion, and the latter chiefly, in steadying the leg on the foot. The ligamentous envelope which ensheaths the tendons and binds the malleoli to the astragalus is of great density and strength, and, like the ligamentous insertion of the quadriceps at the knee, into the patella, is so firmly incorporated with the external surfaces of the bones, that when put on a great and sudden strain, it gives way before the ligaments divide.

The ankle-joint is so formed, that without its extensive tendinous and ligamentous braces, luxation must be a common event. In its normal state this is scarcely ever possible without fracture of the epiphyseal ends of the tibia or fibula or both. In the production of lesions, attributable to indirect violence, which expends its force on the tibio-tarsal articulation, the tarsus, the astragulus and calcaneum are always passive agents, while the sole active factors are the leg, or the articular ends, of its two long shafts.

Although the epiphyses of the tibia and fibula appear before the third year, their complete union, or fusion, with the diaphyses, is not complete until the twenty-fifth year. According to Cloquet, (1) this process of development is sometimes delayed until the fortieth year, and the process of ossification may remain imperfect through life. The tibia and fibula are bound firmly together at the ankle-joint by a strong ligamentous band, which makes their separation difficult. The fibular shaft, inferiorly, except within an inch of its distal apophysis, is everywhere covered by muscular tissue, and is bound to the tibia above the ligament by the interosseous membrane. The long, broad, flange-like process of the fibula, which constitutes its inferior articular end, extends much farther down the lateral wall of the astragalus than its fellows. Its articulation with the head of the astragalus, though continuous with that of the tibia, is horizontal. The function of the

* Read at Annual Meeting of New York State Medical Association, Nov. 10, 1892.

1 *Anatomie des Os du pied*, p. 167. Cloquet.
1 *Anatomie des Articulations*, p. 203, ed. ii.

fibula, then, is severely limited to steadying, and not supporting the leg on the foot. The head and shaft of the fibula consist of more compact than cancellous tissue, hence are less resilient and more brittle than the tibia. The inner surface of the latter bone, from its superior articulation to its inferior, is wholly uncovered by muscular tissue; and as this bone in locomotion is subjected to constant concussive forces, it is rich in cancellous tissue, and is elastic.

Having thus far examined very briefly, into the structures and their arrangement which enter into the proximal segment of the ankle-joint, and the parts with which they are in immediate contact, it will be easier to intelligently appreciate those abnormal conditions here situated, which arise from accident. These may be divided into lesions of the soft parts; the tendinous, ligamentous and cartilaginous; and into those lesions of an osteo-arthritic character, in which there are combined, fracture and dislocation. Free action at the ankle-joint may be destroyed and a permanent crippling remain, after a severe sprain at this articulation, which primarily in no way affects the bones. Many of these sprains, if not so serious, may, however, give as much or more pain than a fracture, or require a longer time to recover from.

The pathological elements which enter into a severe sprain are entitled to summary review, in order to estimate the extent of injury as well as forecast the probable results; and, at the outset, it may be well to remember that the appearance of the soft parts, which enclose the joint, or are continuous with it, often bear no relation to the gravity of the injury. In a given case we may find the integuments greatly tumefied and discolored for a considerable distance above and below the joint, yet the patient has little pain, unless on motion, and in a short time recovers full functional use of the joint. With another, although the swelling is only moderate and there may be but slight if any ecchymosis, yet pain lingers, the inner surface of the dorsum of the foot is extremely sensitive to pressure, and this pain extends up along the leg, over the thecal envelopes of the tendons.

With these sprains of a more grave description it may be quite impossible to put any weight whatever on the foot. With those minor sprains of the first-class, there is always a free extravasation of blood into the capsule of the joint; often associated with a laceration of and leakage from the thin-walled veins in the cellular membrane. Hæmorrhage into a joint is quickly absorbed and gives rise to little inconvenience; the over-tension of the tendons and contusion of the parts promptly giving way to the bath, bandage and rest.

With the more severe phase of ankle sprain, important structures have been severely injured, and amytrophic changes with limitation or diminution of joint-action is sure to follow, if active and appropriate measures are not employed early. With many of these the ligaments have been ruptured, the nerves over-stretched or lacerated, the capsule of the joint over-strained; and with the bones, their periostial envelope or their cancellous elements may take on inflammatory changes. When the injury has not been very great, or vital parts have not sustained serious damage, and the patient has a sound physique, full functional restoration is generally secured.

Certain sprains of the ankle attended with over-strain of the tendons, and followed by inflammation of the synovial lining of the thecal envelopes of the tendons, synovitis, neuritis, periostitis, and arthritis, may end in anchylosis or muscular atrophy, with a weak, painful articulation. In one of these cases which I have seen, although there was moderate motion in the joint, yet along the cutaneous filaments of the internal division of the plantar and internal saphenous nerves, hyperæsthesia was most acute on the slightest motion, and locomotion, without the aid of crutches, was quite impossible for a long time.

In all the other cases which I have examined, there was anchylosis present, muscular or osseous. In some of them there was a retractured state of the sural muscles, requiring the use of a raised heel in walking. It goes without saying, that should this immobilized state of a joint be permitted to continue long enough, muscular wasting must invariably follow, with degenerative or organic changes in all the structures of the leg, ankle and foot.

Contusions of the Ankle.—Contusions of the ankle are always the result of direct violence, as kicks, blows or crushing injuries. Perhaps the most severe of the latter type which we encounter, are in large, modern cities or villages, occuring

in consequence of railroad injuries. The lower third of the leg to the heel, is mostly devoid of muscular tissue, as it is in its upper portion that the greater part of the muscles taper into tendons. In females this region is rotund, the bones being well covered with a thick layer of adipose tissue. In the healthy, active male, but little fat is lodged here; hence the bones and sinews are very superficial. This is preeminently the region of the body in which the consequences of degenerative, vascular changes may be most frequently seen and studied. It may be said, that fully 25 per cent. of all adults, either before or after fifty years of age, present disturbances of nutrition in the lower region of the leg; the subcutaneous cellular tissue undergoing absorption, the skin, through atrophic changes, parting with its natural color, vascularity, mobility and thickness, becoming on the inner aspect, very thin, brittle and intimately adherent to the underlying bone surface; the walls of the inner saphenous vein, with the superficial and deep tributary trunks, as a result of trophic changes in their muscular walls, enlarge or rupture their valves, undergoing very considerable dilatation, wasting and displacement or absorption. In all those cases, in consequence of an imperfect circulation, the periosteal envelope suffers from the effects of impoverishment; so that the osseous tissues of the tibial diaphysis are nourished chiefly through the deep arterial vessels which course through the canals of Havers, rather than those on the periphery.

As a result of these pathological changes, the integrity of the bone suffers serious impairment. It becomes fragile, and susceptible to injuries, which may pursue a chronic course; the shaft is more readily fractured, and is never again capable of perfect repair.

It is clearly apparent, then, the age and the previous condition of the parts at the seat of injury, must always, in a very large degree, determine the ultimate, definite results in every case of severe contusion of the soft parts, or the bone, with or without a laceration, in the vicinity of the tarsal ends of the tibia and fibula. The extent of sudden and great compression force which the skin can sustain without being wholly destroyed, or without the fracture of bone, and which it may wholly recover from, is astonishing. Many cases of this description have come under my observation. It was not until it had been proven, on the trial in courts of justice, and I had examined several well attested cases, that I could convince myself that it was possible for the wheel of a railway street-car to roll over the leg without inevitably affecting its complete destruction at the location of injury. Certainly, the rate of speed and weight of the car, whether empty, or heavily loaded with passengers, will make a difference in the the quality and extent of injury.

Lesions of the Soft Parts Overlying the Tibia-Tarsal Articulation Associated with Dislocation, or Fracture, or Both.—The force necessary to sunder the tendino-ligamentous junction at the ankle, sufficiently to separate the head of the astragalus from the articular ends of the tibia and fibula, at the same time opening widely the joint, with or without fracture, almost invariably causes such complete disorganization of the blood-vessels and nerve-trunks as to render amputation imperative. Such an injury always results from direct force, expending its energy on unlimited area. In this class of cases, the shock to the system is always well marked, and even though complete reduction is possible, a painful, palsied, or anchylosed joint remains. A complete, compound-displacement or dislocation of the head of the astragalus, out of the tibio-fibula mortice, I have never seen, nor can I find such a case on record, except in injuries mortal to the joint structures.

A visible, tangible, partial dislocation or luxation, either forwards, backwards, laterally, anterio- or posterio-lateral at the ankle-joint, is very rarely witnessed, without fracture of the diaphysis of the fibula and a diastasis of the apophysis of the tibia; in other words, the actual condition commonly encountered is a *fracture-dislocation*, the morbid anatomy of which is limited to physical disorganization of the bones, with a displacement of their articular surfaces, attended with hæmorrhage, laceration of the soft parts, and a condition favorable for the advent of inflammatory changes.

This brings us to a consideration of what is now-a-days commonly designated Pott's, or Dupuytren's fracture of the fibula. As this lesion derives its greatest interest and importance from the distortion or dislocation, which leads often to ultimate impediment in movement, this feature deserves special attention.

Pott's Fracture; Dupuytren's Fracture; Fracture and Dislocation of the Tibia and Fibula.—The lesion of the above designations, which is limited to the ankle-joint when the typical form is present, must always be regarded as a very grave injury; for, notwithstanding what may be said to the contrary by contemporaneous writers, our most improved methods of modern surgical treatment have rendered us little, if any, aid in obviating the diminished strength, joint action and deformity, which, with the patient in the hands of the most experienced, may occasionally follow. In many respects this injury resembles a Colles' fracture, a condition which, in spite of the almost endless varieties of apparatus devised for its treatment, has thus far defied surgical art, leaving the patient with a crippled or deformed hand in a certain number of cases.

Both are fracture-dislocations, occurring always, with very rare exceptions, in adult life, and in consequence of indirect violence. Like Colles', the typical injury in Pott's fracture is not so much confined to the bone elements as to the soft parts, the synovial membrane, the vessels, nerves and tendons. The ideal aggravated tibio-tarsal dislocation, accompanied with a diastasis or fracture, happily is not common, like the radio-ulno fracture dislocation. In a statistical table of all the fractures treated in the Harlem Hospital interne service, which has been very kindly prepared for me by Dr. George D. Kahlo, the present house-surgeon, it will be seen that in 1,044 fractures of all kinds, there are but forty-four, set down as Pott's. About two-thirds of them came under my care; and, I may say, that among those there were none, not a single one, which did not yield to simple treatment and quit the service—when they remained with us during their entire course of treatment—with fairly useful joints, and little, if any, appreciable deformity. We have been fortunate. The arthritic lesions were not of a serious character, or our results would have been different.

Many of these cases, here tabulated occurring in my service, were not examined by me, as they were splinted and adjusted when I saw them; and hence, it is probable that there were several of them diagnosed by the *internes* as Pott's which were wanting, in all the essentials which go to make up that fracture. In no other way can I account for the discrepancy between our figures and Malgaigne's tables. He collected 160 cases, and found that they constituted but three per cent. of all fractures which entered his service. He saw no case in patients under fifteen years of age, and but two in patients over seventy years. In Dupuytren's 207 collected cases, two per cent. of all fractures were of this form and of these, ten per cent. occurred in females. Seventh-tenths occurred on the right side, and nearly two-thirds were met with in the winter season. This author maintained that fracture of the fibula was always consecutive to that of the internal malleolus.

Malgaigne (1) fixed the heel of the cadaver in a vice and made forcible adduction, when he found that the internal malleolus fractured first, the fibula fracturing consecutively. He then reversed the experiment, using the foot as a lever, and making forcible abduction the same sequence followed. On the contrary, Maissoneuvre, (2) repeating the same experiment, employing abduction, completely ruptured the internal lateral ligament, without always fracturing either malleoli; though when this occurred the force applied spent itself on the tibio-fibular ligament, and diastasis at the tibio-fibula articulation followed, permitting of a twisting, rotary motion and fracture of the fibula some distance from the joint.

Stimpson's (3) experiments on the cadaver seem to bear out Maissoneuvre's observations, for he says: "It will be seen that by fixing the leg and forcing the toes outward, while the ankle is held at right angles, the first to yield, is the exterior tibio-fibular ligament, then the anterior fibres of the internal lateral ligament, and almost coincidently the fibula breaks by the twisting of its lower end," etc. This author claims that the same sequence occurs clinically.

The incongruous results of the experiments of these distinguished authors are hard to reconcile, though it is quite obvious that the subjects experimented on were of different ages, or that there was a difference in the quality of force employed. In any event, deductions arrived at from experimental work on the bone of the dead body, possesses at best but a relative

1 Malgaigne: "Elementes de Chirurgie," Frac. and les Disloc., p. 307.

2 Maissoneuvre: "Fracture du Perone," etc., p. 172.

3 "Pott's Fracture at the Ankle," Mass. Med. Soc., June, 1892.

value and can under no circumstances be regarded as definite and conclusive.

Such are the theories as to causation from an experimental stand-point; but, as we are dealing with lesions on the living being, it may be well to stop for a moment and review the influences which bring about the so called fracture of Pott, during life. The first influences, which we must not lose sight of, are those innate to the bones themselves. This fracture is scarcely ever seen until the processes of ossification are complete. The premature ossification of the bone, or a preponderance of compact non-vascular tissue, may favor a morbid brittleness, so that a wrench or twist produces here what is known by the French as fracture *par arrachment;* whereas, otherwise, nothing but a severe sprain would follow.

Varieties of fracture—Dislocation of the Ankle Joint.—It has been seen then that it is only when the extent of dislocation is considerable, the displacement and laceration of nerve, tendon and ligament extensive and that a double fracture has occurred, that there is present a condition of a very serious character. But there are many intermediate phases of this injury, in which the degree of destruction, or derangement of one structure, is much in excess of another; for it is as absurd as it is erroneous to assume that every case of tibio-fibular diastasis, or apophyseal separation of the tibial flange, with or without fracture of the fibula, is a grave injury, demanding special and protracted care. In those cases in which the extent of separation of the broken internal malleolus and the degree of regular deformity is not great, reposition and retention are attended with no difficulty. When the head of the astragalus has sprung back into its socket and thereby maintains perfect extension, the interosseous-membrane aids in fibular fixation; so that, no matter how oblique the fibular fracture may be, its coaptation and solid union are readily effected.

In a severer form of Pott's fracture, intra-articular hæmorrhage, cellulitis or synovial inflammation are complications which may greatly retard recovery, or terminate in an inflammatory infiltrate of osseous or other cellular deposit; which, external to the articulation, may cause an undue pressure on the neural cords on their way to the foot; a muscular or tendinous anchylosis; or an undue pressure on the blood-vessels. In another, the most serious and unmanageable of all phases of fracture-dislocation at the ankle, along with a double fracture, the dense, broad, internal lateral ligament is completely torn in two, on the same line as the tibial apophysis is snapped off. By this rupture the equilibrium of the joint is lost; the foot, fixed with the weight of the body concentrated on the horizontal articular surface of the tibia, which has now lost its moorings, now turns on its own axis, and, in this twisting motion, sunders the tibio-fibular union; the same spiral motion ascending splits the fibula shaft in its most brittle and exposed part. The head of the astragalus having left its mortice, may occupy various relations with the articular surface of the tibia. Now the powerful and unopposed muscles of the leg, acting on the foot, through spasmodic contraction cause great displacements, tear widely open the capsule, and cause a great derangement, contusion and laceration of the vascular and neural elements lying in close relation to the joint.

Subsequent inflammation from this violent sundering of a powerful joint is inevitable. It would be quite inconceivable that after treatment of any description, anything like perfect functional restoration after an injury of this description were possible. And such is the case. The swollen sensitive joint can be retained with safety, by resort to pressure or traction sufficiently long to complete repair; but admitting this, by the time the adjustment could be removed, we should have solid, fibrous or osseous anchylosis.

This latter type, then, and this only, is that which Percival Pott so fully and clearly described, and is the only fracture at the ankle which should bear his name.

Diagnosis.—When there is a difference of opinion as to the precise morbid structural changes which constitute a certain specific lesion, it is clear that a definite diagnosis of it is attended with many difficulties. This is particularly the case with apophyseal fractures. It was most unfortunate that this injury ever was designated *Pott's* fracture, for the theory of causation as described by the English surgeon, and the principles of treatment formulated by him, were disputed by Dupuytren, and have in a large part recently been ignored by Stimpson. This wide divergence of opinion on cardinal features would imply that it was not quite the

same lesion on which each made his observation. It would greatly aid then in diagnosis if this so-called Pott's fracture were simply designated "fracture dislocation" at the ankle joint, when we find luxation or sub-luxation coincidently with fracture. From the same precise physical phenomena as obtain in Pott's, we may have a fracture with or without displacement of the internal or the external condyle. I have seen a considerable number of these cases, in winter seasons, when the patient will tell us that he stepped on a cinder or cobble-stone and "turned his ankle." In these cases the internal or the external lateral-ligament has given way, often permitting a rolling inward or outward of the head of the astragalus, with an inversion or eversion of the part, thus constituting another type of fracture-dislocation.

When there is complete separation and mobility, these fractures may be readily detected without difficulty at the first examination. If there be no displacement, then, unless the muscles are well relaxed and considerable force is employed, crepitus is absent, and the presence of a fracture must often remain in doubt; then, I hold, the employment of an anæsthetic with violent manipulation must be condemned.

One should always hesitate in cases of fracture dislocation at the ankle, when a break in the bones is unquestioned, to at once stamp it a Pott's fracture, for the profession, as a whole, have an exaggerated notion of the seriousness of this lesion; and, as has been pointed out, it is only in those cases attended with marked irreducible dislocation and extensive damage to the arthritic structure, that this designation is at all applicable.

Treatment of Sprains, Contusions and Fracture-dislocations at the Ankle-Joint.—The treatment of sprains and contusions may be studied together, for the same line of treatment dominates in both when neither is attended with laceration of the skin. Our measures should vary according to the different phases of pathological changes presenting. If called immediately after injury, the end will generally be met by applying such a therapy as will relieve pain and give the patient comfort. Our efforts should also be directed energetically with a view of preventing the development of inflammation. The limb should be placed in an elevated position, well supported, the use or disuse of the bandage depending on the manner in which it is tolerated. In most cases, applied early, before the supervention of inflammation, it is of infinite value, to relieve the arterial throb, overcome muscular spasm, and steady the joint. If there be very much pain, with or without tumefaction, and there is sanguineous effusion into the capsule or soft parts, then the free application of leeches and local depletion is a powerful prophylactic against pain and subsequent inflammation. Bathing, either cold or warm, rubifacients or counter-irritants, will be required in many, and serve a useful purpose.

One of the most important questions of late years in the surgical treatment of severe joint contusions and sprains has been with reference to immobilizing the limb—giving it rest, as it is said. Immobilizing a sprained ankle-joint by plaster-of-paris, as a conventional method, is a practice which cannot be too strongly condemned. It is true that the injured part needs temporary rest, but physiological rest must not be confounded with immobilization. The joint may be amply supported by the simplest sort of ordinary splinting, which will permit of ready removal, moderate motion, massage, application of medicaments to the bandage, and other measures. But, with the knee flexed and the sural muscles relaxed, a well-padded bandage applied, and the limb swung or supported, any sort of splinting is very often unnecessary. Since, then, any sort of permanent fixation is so liable to be followed by anchylosis, we must be on the alert for this unfortunate sequela, and in the general run of cases, if it supervene, we are responsible for it.

It is surprising with what rapidity degenerative changes set in in contiguous parts after joint injury, when all joint motion is completely arrested. There is in the child an immediate cessation of growth, and in the adult so profoundly are the nutritive processes affected, that atrophic and degenerative changes pursue a swift and destructive course, so that, after the lapse of but a few weeks, all hope of restoration of normal joint-action is forever destroyed. Passive motion, then, should be contemporaneous with other measures. When, owing to the severe and unbearable pain which this may give rise to, it cannot be practicedf then we may be assured that the brunt o, injury has been borne rather by the bone

than the soft parts, and that pathological changes are advancing in the bone element, which we can only modify or arrest, by bold and prompt antiphlogistic procedures.

It is obvious, then, that in severe ankle-joint concussions or twists we must treat them with promptness, energy and patience, avoiding above all things protracted immobilization; and with the child, in whom arrest of growth in the affected limb means crippling for life, employ no device which might seriously interfere with nutritive processes. Should anchylosis, however, follow our treatment, or be present when we are called to attend the case, let us be assured that it is a stiffening and joint distraint, arising entirely from positive molecular organic changes, before we decide that it is beyond relief and are content with the let-alone policy. I have seen quite a number which have been entirely cured of their lameness, more than a year after their injuries, by thoroughly breaking up the adhesions in and about the joint. Of course, it is needless to say that before one will undertake to break up an anchylosis, he must very carefully examine the bones and test the muscles, or he will, in unfit cases, surely fracture the shaft, as I did myself in two patients, in my very early experience. In both cases the bones were more fragile, through pathological changes, than were the adhesions.

The management of Pott's fracture, by those best known to the profession as authors of treatises on fractures, has been on most divergent lines. Dupuytren and Hamilton bound the foot and leg to an internal splint, with the foot markedly abducted, the several muscles being relaxed by the bending of the knee. Pott himself said little about splints, but attached great importance to posture. Speaking about this, he said: "The limb should be laid on its outside, with the knee moderately bent; by this the muscles forming the calf, and those tendons which pass behind the fibula and under the os-calcis, are all put in a state of non-resistance, when all trouble and difficulties will vanish immediately. The foot being easily placed right, the joint reduced, and by maintaining the same disposition of the limb, everything in general will succeed very happily. as I have often experienced."

The more modern plan of fixing the fragments and the joint is by splinting material applied about the joint, the limb extended and resting on its dorsal aspect. Such is the plan recently recommended by Prof. Stimpson. But let us not forget, that we are something more than moving automatons, and in dealing with this species of injury, we should as in any other, treat it on sound surgical principles, regardless of the individual preferences of different surgeons. Let us appreciate the fact that we have a fracture opening into a joint, with more or less displacement of the articular surface. When the tibial head is driven far forward and torn through its capsule, the anterior and annular ligaments, there are no means known to science by which we can give our man a new set of ligaments; and hence this dislocation, as others which we occasionally see, may be entirely irreducible, or, if reducible, it cannot be retained, without dangerous pressure, or anchylosis. When the head of the astragalus is anterior, and the tibial surface posterior and below it, extensive, ligamentous laceration or overstretching is inevitable. Decided lateral luxation entails, also, either rupture of the ligament, or else it has given way only by a tearing off at its osseous surface of attachment, even carrying some of the bone substance with it. It is clearly apparent, then, that as this element of dislocation in aggravated cases predominates, its efficient reduction and retention are what should particularly concern us. For the efficient accomplishment of this purpose postural treatment occupies preeminently the front rank. Muscular relaxation, topical applications, the bandage with appropriate supports, will, as Pott has well said, suffice in most cases. It must not be overlooked, however, that when joint disorganization has been very considerable, and active inflammation follows, defective joint action with deformity can, in no way, be wholly obviated.

Whatever line of mechanical treatment may be instituted, it is well to know that this has its limitations, and, if misdirected or too protracted, may conduce to a pathological condition and make the joint and foot more serious than if nothing whatever had been done. The trophic changes, wasting, and loss of function which invariably follows, in varying degrees, traumatic or pathological joint lesions and fractures, are clearly and concisely described in a classical production recently presented before the American Orthopædic Association by Prof. Roswell Park ("A Study of Atrophy," *Gaillard's Medical*

Journal, October, 1892). The conclusions in this brochure, derived from the experimental and clinical observations of French, German, English and American surgeons, are remarkable and valuable for the general accord with which all agree:—that an injury to the shaft of a bone, or to any of the joint structures, an arthritis or osteo-arthritis, which causes protracted inaction or long-continued immobilization, invariably induce an arrest of growth, degeneration of bone-substance, muscular wasting, with impaired or entire loss of function in the affected limb. Therefore, in traumatic osteo-arthritic lesions, in fracture-dislocations at the tibio-tarsal articulation, as in a Colles' fracture or a fracture opening into the elbow-joint, the greatest caution should always be observed in severe cases, to remove every sort of fixation apparatus, at the earliest possible date; with a view of commencing passive exercise, and thereby preventing organic changes in the structural elements of the bone and muscles, which might lead to temporary or permanent muscular or arthritic anchylosis attended with a low grade of synovitis and a bloated, œdematous phase of cellulitis.

For the purpose, then, of maintaining the normal nutrition of the joint, and obviating, as far as possible, subsequent impediment in motion and diminution in strength, massage, friction, uniform but interrupted pressure, early and constant, are important and vital accessories. The precise time at which digital manipulation and ankle motion should commence will depend, in a certain measure, on local conditions. If there has been an extensive rupture of ligament and tendon, any disturbance of adjustment-pressure is immediately followed by a subluxation; then immobilization must be continuously maintained over a considerable period of time, though at the expense, perhaps, of an anchylosed joint. But this condition is exceptional. In those cases in which the chief lesion is osseous, the propriety of disturbing the fragments by early handling of the foot might be questioned, as such interference might seem to retard union, or render it less effective.

My experience, however, in the treatment of fractures in general, as well as those here considered, has been that the changing of dressings, moderate kneading of the muscles, with slight motion of the fragments, seems rather, on the contrary, to stimulate processes of repair and accelerate osseous fusion. Fortunately, in any event, in these ankle-lesions, in which after the most judicious treatment the range of motion is restricted or is entirely lost, still, with a stiff joint the limb often remains firm and useful, a thousand-fold more so, than any artificial substitute can ever render it. In those extreme cases, in which, through tibio-fibular diastasis and ligament rupture, there has been an irreducible axial rotation of the head of the tibia on the articulating surface, with pronounced posterior or lateral displacement, a weakened, crippled joint remains, which necessitates in locomotion the comfortable adjustment of some sort of prothetic appliance, which will give ample support, and, perhaps, prevent pain, on motion of the limb.

My practice is never to undertake to liberate a joint with any anæsthetic. The two accidents cited happened while my patients were under ether. While, on the contrary, in every instance in which I have been able to open the surfaces, by a sudden but cautious motion, without ether, the results have been permanent and good. In my judgment, it is much better, in genuine, osseous anchylosis, to divide some of the tendons and open the joint if necessary, if otherwise the application of great force is rendered necessary.

FRACTURES OF FIBULA AND POTT'S FRACTURE.

Diagnosis	Male.	Female.	Cured.	Improved	Unimproved.	Cured.	Discharged.	Transferred.

EXPERIENCES IN PELVIC SURGERY.*

By A. V. L. BROKAW,
ST. LOUIS, MO.,

PROFESSOR OF ANATOMY AND DEMONSTRATOR OF OPERATIVE SURGERY, MISSOURI MEDICAL COLLEGE; SURGEON TO ST. JOHN'S HOSPITAL; CONSULTING SURGEON TO CITY AND FEMALE HOSPITALS, ST. LOUIS, MO.

Of all the surgical problems difficult to solve it may be truthfully said that those met within the pelvis are the most trying. I know of no surgical work which can compare with the experiences found in the pelvis; such a diversity of conditions, complications and unexpected happenings are ever presenting.

In a series of many operations but few will be alike in every particular. Uncertainty of making an absolutely correct diagnosis before operation enters largely into the experience of all operators in this field.

When I had a little experience in this work I could always make a diagnosis and quite frequently verify it after operation. With an increasing experience, I find myself well satisfied with an approximate diagnosis.

The diagnoses of the pus cases are usually clear, and one makes a correct diagnosis in the majority of cases. It is in the other pelvic conditions where we make our errors of diagnosis. We might very properly state that only those without operative experience, or the theorists, always make a correct analysis of their cases. Individually, I frankly admit my inability to correctly diagnose the character of abdominal and pelvic troubles increases as my experience becomes larger. I have diagnosed pus tubes and found extra-uterine pregnancy; diagnosed extra-uterine pregnancy and found pus; diagnosed ovarian lesions and found the trouble located in the tubes and *vice versa*.

This experience tallies with that of all the most prominent workers in this domain of surgery with whom I have conversed.

The bad results in pelvic work are frequently found to be the result of neglect, often of ignorance, and very frequently of a want of resolution in the attendant. An early use of the knife in many cases which eventually pass into our hands would have given far more brilliant results, and improved generally the present statistics in pelvic surgery. The number of cases we see in the early stages of disease are relatively few; by far the greater number are in a late stage of disease, and not a few on the verge of dissolution.

The criticism passed upon pelvic surgeons, that they often operate when operative proceedings are unnecessary is usually unjust, and simply the gratuitous statement, actuated by bad motives, of those without personal experience. No conscientious, earnest surgeon has a thought but for the best interest of those placed under his charge.

When well defined pelvic lesions exist nothing short of radical measures succeed. Abortive attempts at dealing with pus or other threatening conditions only bring disastrous results. I am a believer in the conservatism so well defined by McMurtry in a recent paper, and I heartily recommend the perusal of that erudite article to the critics who never operate.

That needless, reckless surgical procedures are perpetrated in the pelvic work of a few we will not attempt to deny; however, the same is true in other directions, particularly so in the cerebro-spinal surgery which recently threatened to become epidemic.

The routine gynecologists are largely responsible for much of our work. By a routine gynecologist, I refer to the gynecologist who treats all his cases alike. One who introduces a speculum, paints the cervix with iodine, makes local applications to the cervical canal or within the uterus itself, insufflates some boracic acid, introduces a glycerine tampon or pessary and requests the patient to come again in two days. This soft impeachment cannot be denied.

The specialist should recognize conditions imperatively demanding operative interference and not nurse cases along in the described manner until they become "wrecks"—wretched examples of what electricity, the sound, dilator and cautery can do for women.

What I have said in these paragraphs does not apply to all specialists in women's diseases, but, unfortunately for the other sex, it does apply to the majority. Much of my work comes to me after all the

* Read before the Southern Surgical and Gyn. Association, Nov. 16, 1892.

methods of minor "gynecological tinkerings" have been exhausted. The most difficult "pus" operations I have performed have followed prolonged treatment at the hands of gynecologists, or better, the pseudo-gynecologists. An example of the character of the cases one meets with after meddlesome manipulations with the sound will be *apropos*:

Mrs. C., suffering with dysmenorrhœa of some severity, was recommended to a local specialist who told her "that the mouth of the womb was closed up" and it would be necessary to dilate it at once, which operation he immediately set about to perform. A uterine sound was introduced. This caused no little pain, but she was assured that was to be expected. At midnight her attendant was summoned in haste to see his patient suffering excruciatingly. A high temperature and great abdominal tenderness were present, and then for six weeks, a severe form of peritonitis was combated. As a result of the opium treatment of the peritonitis the patient became addicted to morphine; was treated by various local neurologists and wound up in Philadelphia where she was temporarily cured of the habit by Dr. Mitchell. While in the East she was examined by our distinguished friend, Dr. Barton Cook Hirst, who advised operation for well marked tubular disease and abscess of the ovaries. The case was referred to me for operation after her return, St. Louis being her home. Operation revealed universal adhesions, multiple pelvic abscesses, ovaries and tubes containing several ounces of pus. The adhesions were dense and the most difficult to deal with that I have ever met. The serous coat of the neighboring intestine was stripped off in many places in the process of enucleation. After a free flushing, a tube was introduced and my troubles began. The morphia mania returned, the patient became uncontrollable and insisted on having morphine whenever she desired, in spite of earnest entreaty. From then on she took full charge of her case and the nurses were unable to manage her. The tube began to discharge fecal matter on the third night after the operation and continued to do so for seventeen days, when it suddenly ceased, the stercoracious fistula closing rapidly.

I might detail other cases which have come under my observation demanding operative interference where the inflammatory conditions were the result of the introduction of the sound, caustics, etc.

But a few weeks since, it was necessary to operate in an emergency on a leaky pus tube which had its origin in a like manner. The original tubal disease had been treated with an intra-uterine grooved stem pessary, the idea of the attendant being that drainage *per viam naturales* would follow. Vaginal incision is a favorite method of treatment of pelvic pathological collections with some. In my experience but few, if any, of these cases can be considered properly or perfectly cured by such means.

We find multiple abscesses in the largest proportion of cases which cannot be drained by efforts so blindly and indirectly made. The abscesses may or may not communicate with one another and usually but one such abscess would be drained by a single vaginal incision. To illustrate: An intelligent practitioner recently requested me to see his wife who had been having recurrent attacks of peritonitis. She had undergone a vaginal incision eighteen months before her present attack of peritonitis. Was relieved for a few months, but latterly had been losing ground on account of numerous attacks of peritonitis. I found the pelvis choked up with inflammatory masses, a fixed uterus, and at site of the old incision, a soft bulging point in the otherwise board-like vaginal vault. Her husband wished me to open the threatening abscess, which I refused to do as a matter of principle. The abdomen was distended with signs of an aggressive peritonitis present. A temperature of 103° and over had existed for two weeks prior to my visit. I suggested a section which was not agreed to. A few days later I was summoned in haste. All the symptoms had become aggravated and her condition, indeed, alarming. Consent was given to an operation. The peritoneum was thickened, omentum agglutinated in every direction, matted intestines, a pint of pus in the pelvis, multiple abscesses surrounding the uterus on all sides. An abscess the size of an egg isolated from the other pus collections proved to be the one pointing into the vagina. The abdomen was flushed, tubes inserted and my late evening visit found a normal temperature. Recovery from that time on was uneventful. Had I been persuaded to

make the vaginal incision, the register would have "rung up" another surgical failure.

An experience in extra-uterine pregnancy forces upon me the wisdom of Tait's law of exploratory incisions in obscure diseases of the pelvis and abdomen. The force of his arguments cannot but grow in favor and importance in the estimation of any one with surgical instincts who desires to do what is best for his patient.

The one condition above all others where exploratory incision should be adopted is in cases of suspected extra-uterine pregnancy. It is correct and good surgery to open the abdomen and not wait for all the classical signs to appear. They may come it is true, and your patient may be lost by procrastination. It may not meet with the kind accord of this body of distinguished specialists, but it is my belief that in all cases of suspected extra-uterine pregnancy it is best to do an exploratory operation—a short clean incision. If nothing is found you have at least relieved your mind of anxiety born of the fearful experience such cases can only give. What surgeon hesitates to operate in accessible aneurisms? Yet in extra-uterine pregnancy, do we not have a condition equally as bad? The text-books advise that electricity and other measures be tried first and operative procedures later. The results of such teaching, we read of in the mortuary columns of the daily press. The symptoms of extra-uterine pregnancy are so frequently obscure and unreliable that I am firmly convinced that the radical position taken is correct.

An example of an unusual history in a case of extra-uterine pregnancy is now under my care. Operated upon three weeks ago. Mrs. T., æt. twenty-eight, the mother of four children; desirous of no further increase in her family, having missed one period, on advice of a neighbor took repeatedly large doses of oil of tansy; was seized with flooding and supposed she had aborted. Hæmorrhage became profuse. After several days called in a physician. "Had some fever and slight chills." The discharge was offensive, the womb curetted with a blunt curette and a few clots removed. Fever did not abate but rapidly rose; great tenderness and symptoms of peritonitis rapidly developed. Was seen by me the night of the eleventh day. Temperature 105°; surroundings were bad and patient was sent to the hospital at once. Operation early the following morning. Appearance of patient peculiarly bad, pulse weak. Section, abdomen filled with blood, extra-uterine pregnancy right side. Patient's condition on the table alarming, —almost pulseless when abdomen was opened, Tubes rapidly enucleated and tied off; free saline irrigation; drainage tube placed in position; usual treatment of impending collapse instituted. Reaction very gradual, but followed by complete recovery. Temperature never reached above 101°, normal after the first week.

My faith in the dorsal position, short incisions, drainage in nearly every case and free use of hot water, remains, and I do not see the advantage, if any, of a departure from such technique.

SHOCK.*

By JAMES EVANS, M. D.,
FLORENCE, S. C.

In the severe injuries inflicted on the body by accident and the major operations of surgery, not the least element of danger to life is the condition known as shock, which rapidly supervenes. The torn and lacerated tissues may involve only a small area, the hæmorrhage may be inconsiderable in amount, or the limb which has been crushed may under other circumstances be removed without any great menace to the life of the individual, yet the shock may be so profound and persistent as to resist all efforts to avert death. The degree of shock is not determined solely by the extent and gravity of the physical injury. Certain idiosyncrasies of constitution, the character of the force which inflicted the injury, and the circumstances under which it occurred, are potent factors in its determination. Individuals of a highly wrought and exquisitely sensitive nervous organization bear pain with far less fortitude, and are more susceptible to shock than those of dull and obtuse intellects and blunted sensibilities. If the agent which has caused the injury has vividly impressed the mind with its great power, and that it is capable of exerting a force irresistible and crushing in its character, the shock is always pro-

*Read before the Southern Surgical and Gynecological Association, November 17, 1892.

nounced. A shell-wound is usually attended by more shock than one from a ball, although there may be no greater destruction of tissue. A similar reason may be assigned for the severity of shock in railroad accidents, and the injuries inflicted by powerful machinery. It is evident, therefore, that the physical injuries are not the only cause of that assemblage of symptoms which is designated *shock*.

The prime factor in its production is the impression made on the mind by the perception of the threatened danger, and the serious consequences which may follow whatever wounds may be inflicted. The condition is not originated by, but precedes the infliction of the injury. The irritation of the nerves of sensation at the point of injury is propagated to the central nervous system, and there likewise originate impulses which being transmitted to the medulla start into action the same reflexes, and the state is thus indefinitely intensified and maintained. Fear is capable of producing such a profound degree of shock as sometimes to cause speedy death, and this result frequently takes place even before an inevitably fatal injury is felt. Even in cases in which the body has sustained no injury the effect is so pronounced and persistent as to cause serious illness, which may continue for many days thereafter. This phase of it is well illustrated in an incident which occurred in the neighboring town of Cheraw.

In laying the foundation of a bridge across the Pee Dee River at that place, an immense block of granite weighing over a ton was being lowered into a pit forty-four feet in depth; at the bottom was a man who was to direct it into the proper position. When this huge block of stone was suspended over the pit the cable holding it began to slip and the man below was warned to crouch in a corner, as it would inevitably fall. The rock did fall, and the man in the pit miraculously escaped without injury, but he was taken out in a perfectly lifeless condition, and was exceedingly ill for more than a week.

Every army surgeon has frequently observed soldiers in approaching the battle-field, when within the sound of a musketry fire, exhibit an uncontrollable desire to evacuate the bladder and bowels. The apprehension of danger, and the uncertainty of the ultimate fate which awaits them, produces irregularity in the action of the heart and respiration, and relaxation of the sphincter muscles, in other words, a mild degree of shock. If wounded just at this time the shock is more pronounced than if it occurs during the heat of an engagement. When engaged fully in action, this feeling of dread soon passes away and is forgotten in the excitement of the battle, and now the severest wounds are received, and shock is deferred for hours, and not experienced until the stage of excitement has passed away. Then it is that the mind takes cognizance of the wound and its gravity, and shock rapidly supervenes. The higher nervous centers being preoccupied have contributed nothing to its production, and at the same time have held in abeyance and controlled the various reflexes, which the irritation of the nerves of sensation at the point of injury have started into activity. Hence shock is deferred. If it were possible to maintain for an indefinite period the mind in this state of control of the reflexes, we should be able to obviate the supervention of shock arising from physical injury.

In the severe injuries sometimes received by men while in a state of profound intoxication from alcohol, the shock is not marked, especially if they are made warm and comfortable, and stimulants are suddenly withdrawn. The effect of alcohol is similar to ether and chloroform,—the nervous centers, from the highest to the lowest, succumb to its influence in the same order of procession. During the state of profound intoxication, consciousness, sensation, and all the reflexes are temporarily held in abeyance, and it is impossible for a nervous impulse originating in any part of the brain, or the irritation of an afferent nerve, to be transmitted to the centers which are instrumental in the production of shock.

In injuries arising from accident, gunshot, and those which occur in the ordinary pursuits of life, it is not in our power to prevent the shock which subsequently follows, but much may be done to relieve it and thereby save life.

The chief indication in the treatment is to relieve promptly the embarrassment to the circulation, and, as this is owing mainly to undue stimulation of the vagi, remedies such as atropia and strychnia which have a sedative or paralyzing effect on these nerves have the happiest effect.

These drugs ought to be administered together hypodermically in doses of one one-hundredth to one one-fiftieth grains, and at the same time external heat applied to maintain the warmth of the body. If the patient can swallow, whiskey or brandy should be given, hot, and but sparingly diluted, in order, as Lauder Brunton says, "to obtain its stimulating reflex action on the heart." The latter can frequently be stimulated into action by firm but intermittent pressure, by the end of the fingers, on the ribs immediately over it. The abdomen should be bandaged with a flannel roller, as it maintains warmth and by its pressure relieves somewhat the plethora of its blood-vessels.

There is much discrepancy of opinion in regard to the administration of morphine hypodermically just before the anæsthetic is given in cases requiring a surgical operation, and when deferred thus late, it is of questionable propriety. But it is of invaluable service not only in mitigating but in preventing in a large measure shock when administered in a proper manner and interval before the contemplated operation. The patient should be prepared and all information of the time of the operation should be withheld from him, and without arousing his suspicions, a hypodermic injection of morphine and atropia given in a sufficient dose to produce sound sleep, and while in this state, the anæsthetic should be cautiously administered so as to bring him completely under its influence without awaking him.

All the phenomena by which shock is manifested are the result of reflex action through the medulla and are caused by impulses originating in the great nervous centers of the brain. Any injury or irritation of the peripheral extremity of an afferent nerve must be propagated to these centers before it can reach the great center of reflex action. To prevent shock therefore, we must endeavor to avoid exciting any thought or emotion which may start these impulses from the great centers to the medulla and give rise to those disturbances which constitute its essence. When a patient undergoes preparation for a surgical operation and is told, even days before, of the time and place, and is borne into a modern operating room with all its paraphernalia of trays and knives, sponges and appliances for rendering a wound aseptic, and sees the preparations being made by surgeon, assistants and nurses, he must have a stout heart and be more than human to view what is taking place around him with stolid indifference and without fear and apprehension as to the final result. Before he receives the usual hypodermic of morphine, or the anæsthetic is administered, he is like the soldier approaching the battle-field, he is already suffering from a more or less mild form of shock. Add to this the stimulating effect on the vagal center of the primary action of the morphine, and if perchance the first cut of the surgeon's knife is made before he is fully under the influence of the anæsthetic, we have an additional inhibitory stimulus which may bring the heart to a standstill and death ensue. Whatever thought or emotion dominates the mind at the moment loss of consciousness occurs from sudden seizure of disease, a traumatism of the brain, or the effect of an anæsthetic, the same thought or emotion on the return of consciousness will still exert a controlling influence, and may give rise to a motor response, or diminish or increase the blood supply to some particular vascular area. If a thought or emotion powerful enough to excite reflex action occupies the mind as it passes under the influence of the anæsthetic, it will reappear in undiminished vigor as soon as intelligence resumes its sway.

On one occasion while conversing with a gentleman of more than ordinary intelligence, a president of a railroad, on a subject in which he was deeply interested, he was suddenly seized with an epileptic convulsion while speaking in the middle of a sentence. The fit was rather a severe one and was followed by coma which continued for twenty hours, and, happening to be sitting by the bed when consciousness returned, he finished the sentence which was interrupted by the fit. Some time ago I was called to see a man in a state of profound coma from a compound, depressed fracture of the right frontal bone near the median line, the wound having been inflicted during a quarrel by a small end of a monkey wrench in the hands of his antagonist. As soon as I trephined and removed a small button of bone which had penetrated the dura, and further had raised the depressed fracture, consciousness returned and the man resumed the quarrel.

Shock is sometimes not very pronounced

from the moment of the injury, yet persists for hours and days before full reaction finally takes place. While the artery at the wrist seems to be full enough it is weak and compressible, and the patient is in a state of somnolence, sleeping most of the time. The impression of the injury on the nervous system is more profound than the early symptoms would seem to indicate, until its recognition is forced upon us by some marked disturbance of nutrition. Apart from the destruction of tissues inflicted by the injury, shock through disturbance of the whole nervous system effects very serious changes in the nutrition of the body, and will cause diseased action in any part from slight irritation, and the skin is especially vulnerable in this respect. The pale and livid hue of the surface of the body is evidence of its nutrition. The blood which nourishes it being propelled by a weak and enfeebled heart flows with diminished velocity through arteries and arterioles of diminished calibre, and cannot convey the requisite amount of nourishment to the various tissues of the body. Hodgekin, as quoted by Erichson many years ago, in 1857, suggested that the condition was due to a chemical poison formed in the wound from innutrition of the injured tissues, and being absorbed into the circulation poisoned the system, in other words, was caused by a ptomaine. The real cause is owing probably to the presence of leucomaines which have been produced in excessive amount from general innutrition of all the tissues of the body from an inadequate supply of nourishment. The impaired vitality and lessened power of resistance of the skin to external irritants is marked and sometimes the death of a skin flap can be attributed solely to this cause. Hence, when a patient has received injuries which render an amputation imperative, and the shock has been persistent, the flap, including some muscle, should be the preferred method, as the small amount of muscle which it includes secures greater vascular supply.

In severe shock the presence of albumin in the urine can usually be detected. In the persistent forms it becomes a serious complication and retards the healing of any wound which may be present, or it may cause the system to succumb to septic influences. Albumin is not the direct result of a wound or injury to the tissues, but arises from the effect of the profound disturbance of the nervous system, which constitutes shock, on the organs chiefly concerned in eliminating effete matters from the body. It was a happy circumstance that the man who was removed from the pit in Cheraw in a helpless condition from shock was examined the previous evening by my friend Dr. Kollock for life insurance, and the urine tested for albumin and none found. A few hours after the accident the urine was again tested and albumin was so abundant as almost to solidify the contents of the tube.

Communications.

THE TREATMENT OF ANAL FISSURE, OR IRRITABLE ULCER OF THE RECTUM.*

By LEWIS H. ADLER, Jr., M. D.

There are some general rules that must always form a part of the treatment of anal fissure, to wit, to lessen as much as possible any inordinate action or distention of the bowel, and to prevent the ulcerated surface being irritated and abraded by the passage of hardened feces.

To fill these indications enemata or mild aperients should be employed, and the diet must be regulated, the use of bland and unirritating food being enjoined.

It is not possible to point out a diet that would be even generally applicable, as so much must depend upon the state of the constitution and the previous habits of the patient; but in general it should be moderate in quantity, yet sufficiently nutritious—what the stomach can digest with ease, and has no tendency to produce constipation.

The patient should be directed to take moderate exercise; and if the bowels are disposed to be costive, a daily evacuation should be secured by the administration of an enema of warm water, or one of rich flax-seed tea, say from half a pint to a pint, to be given every evening, preference being given to the night-time, as the patient can then assume the recumbent posture, which, combined with the rest, affords the greatest protection from subsequent pain.

Instead of the enema, or in conjunction

*Read before the Phila. County Medical Society, November 23, 1892.

with its use, the action of the bowels may be regulated by the employment of some mild aperient, such as the patient has found by experience to agree with him.

All drastic purges should be avoided, as they are more or less stimulating and irritating to the extremity of the rectum.

The pain and spasm of the sphincter muscles attending the evacuation of the bowels is best relieved by the use of a suppository consisting of:

℞—Ext. belladonnæ..... gr. ⅛ to ½
Cocain. hydrochlor..... gr. ¼ to ½
Ol. theobromæ..... gr. x.
Misce et ft. suppositoria j.

One suppository to be employed about half an hour before the enema is given, or a movement of the bowel is expected.

Iustead of the suppository, an ointment of extract of conium may be used, as recommended by Mr. Harrison Cripps:[1]

℞—Ext. conii.. ..... 5ij.
Olei ricini.. ..... f 5iij.
Ung. lanolini.....q. s. ad 3ij.—M.

A small quantity of this ointment should be smeared over the parts five minutes before a passage, and again after it has occurred.

The various methods of treating anal fissure may be divided into the *palliative* and the *operative*.

Palliative Measures. — Palliative treatment will meet with success in cases in which the fissure is tolerably superficial and of somewhat recent origin, especially when there is no great hypertrophy of the sphincter muscles.

Allingham[2] states that the curability of the lesion does not depend upon the length of time that it has existed, but rather upon the pathological changes it has wrought. This same authority states that he has cured fissure of months' standing by means of local applications, when the ulcers were accompanied with polypi or hæmorrhoids, and when there was not marked spasm or thickening of the sphincters.

It is essential to the success of the treatment of fissure, especially by local applications, that rigid cleanliness of the parts be maintained: for this purpose the anus and the adjacent portions of the body should be carefully sponged night and morning, and after each stool, with hot or cold water, the temperature being regulated to suit the patient's comfort.

In applying the various local remedies it is necessary first to expose the ulcer to view, and to anæsthetize its surface with a 4 or 8 per cent. solution of cocaine hydrochlorate, well brushed in with a camel's-hair pencil.

The application may have to be repeated once or twice, at intervals of about five minutes, in order to obtain the desired anæsthetic affect.

If any ointment has been used about the fissure the anus should be subjected to a hot-water douche before using the cocaine. as cocaine will not exert its anæsthetic influence on a greasy surface.[1]

Among the different remedies that have been used in the local treatment of fissure of the anus may be mentioned the following: Nitrate of silver, acid nitrate of mercury, fuming nitric acid, carbolic acid, sulphate of copper, the actual cautery, and chloral hydrate.

Of these topical applications the nitrate of silver is the best. Its effects are various: it lessens or entirely calms the nervous irritation, which is so important a factor in producing spasmodic contraction of the sphincters; it coats and shields the raw and exposed mucous surface by forming an insoluble albuminate of silver: it destroys the hard and callous edge of the ulcer, and tends to remove the diseased and morbid action of the parts.

The form in which this salt is usually employed is in solution (from ten to thirty grains to the ounce). The caustic stick may be also used.

To accomplish the best results the solution should be used once in twenty-four or forty-eight hours, according to circumstances. It may be applied by means of cotton attached to a silver probe or to a piece of wood.

The application is made by separating the margins of the anal orifice with the thumb and index finger of the left hand, and introducing into the anus the probe charged with the solution. The argentic nitrate is to be applied to the fissure only; a few drops are all that is required. If thorough local anæsthesia has been induced by the use of cocaine, the application of the silver salt produces little, if any, suffering, for by the time that the anæsthetic has lost its effect the otherwise acute pain

1 Diseases of the Rectum and Anus, second edition, London, 1890, page 189.

2 Disease of the Rectum, fifth edition, London, 1889, p. 215.

1 W. P. Agnew, M. D.: Diagnosis and Treatment of Hæmorrhoids, etc., second edition, San Francisco, Cal. 1891, p. 91.

of the nitrate of silver will have passed away.

After each application the part should be smeared well with an ointment of iodoform (thirty grains to the ounce). The odor of that drug may be disguised by the addition of a few drops of attar of roses. Iodol may be used instead and in the same way, but I prefer the iodoform, owing to its anæsthetic qualities. After the ulcer has been touched once or twice with the silver solution the effect will be, in the cases that are benefited by this treatment, a considerable mitigation of the pain from which the patient suffered when at the closet and afterward, and the sore will present a healthy, granulating appearance, and will slowly contract in size.

Some authorities speak highly of the use of acid nitrate of mercury, fuming nitric acid, carbolic acid, the actual cautery, etc., but their employment, with the single exception of carbolic acid, is attended with more suffering than follows the use of the nitrate of silver or the simple operative treatment presently to be described. Furthermore, the application of these remedies is not so certain to effect a cure as either of the two procedures just mentioned.

The daily introduction of a full-sized bougie made of wax or tallow, will sometimes act beneficially in cases of fissure by stretching the sphincter and producing such an amount of irritation as will set up a healing process in the ulcer. An application of cocaine or of belladonna ointment should be made to the part previously to the employment of the bougie.

In children and young persons, unless a polypus or a polypoid growth, or a congential contraction, complicates the fissure, it is almost always curable without operation. In children suffering from hereditary syphilis, numerous small cracks around the anus are common, and they cause much pain. Mercurial applications and extreme cleanliness soon cure them, but they will return from time to time unless anti-syphilitic medicines be taken for a lengthened period. [1]

Operative Treatment.—If, after a fair trial of the simple measures that have been recommended, the fissure does not heal, or if, as described by Allingham, [2] the base of the ulcer be gray and hard, and if on passing the finger into the bowel the sphincter be found hypertrophied and spasmodically contracted, feeling, as it often does, like a strong india-rubber band with the upper edge sharply defined, or if there should be a polypoid growth, or any other complication, local treatment will not effect a cure and operative interference will be rendered necessary.

There are three methods of repute to be considered in this connection: incision, forcible dilatation, and a combination of these two procedures, viz., dilatation and incision.

Incision. A fissure can be cured by making an incision through the base of the ulcer and a little longer than the fissure itself, so as to sever all of the exposed nerve-filaments and muscular fibres along the floor of the ulcer. In a certain proportion of cases this operation will meet with success, but it is not so certain and radical as the third method to be described.

It has the advantage over the other two operations, however, of being nearly or entirely painless under local anæsthesia produced by cocaine, and, therefore, when general anæsthesia is contra-indicated, or is refused by the patient, this method is worthy of trial.

Forcible dilatation. This is the operation recommended by Recamier, of Paris; Van Buren, of New York, and others.

It consists of the introduction of the thumbs into the bowel, back to back, and then forcibly separating them from each other until the sides of the bowel can be stretched as far out as the tuberosities of the ischia. It is well to place the ball of one thumb over the fissure and that of the other directly opposite to it, in order to prevent the fissure from being torn through and the mucous membrane stripped off. As pointed out by Allingham, [3] it is well to repeat the stretching in other directions until the entire circumference of the anus has been gone over. In this manner, by careful and thorough kneading and pulling of the muscles the sphincters will be felt to give way, and will be rendered soft and pliable. This procedure should always be practised with the patient thoroughly under the influence of an anæsthetic, and it should occupy at least five or six minutes. The operation is a perfectly safe one, but as it is no less

1 Allingham, op. cit., p. 213.

2 Op. cit., p. 217.

3 Op. cit., p. 226.

severe than the method by incision, and as it fails to effect a cure in some cases, I can see no advantage in adopting it instead of the more satisfactory and always successful plan of treatment—combined dilatation and incision. It may be found preferable, however, in some cases on account of the prejudice of patients against the use of the knife.

Rapid forcible dilatation for the cure of fissure is a method now tried by some surgeons and *apparently* with a fair measure of success.

The patient is placed under the influence of nitrous oxide gas, and the sphincters are quickly stretched either by manual force or else with instrumental power. For my part, I do not see how a satisfactory dilatation can be accomplished in this way. When the cure of fissure by dilatation is attempted under ether-anæsthesia—the muscular system being completely relaxed—the thorough paralysis of the sphincters occupies several minutes before they are felt to yield, and the strain upon the operator's thumbs incident to the operation, becomes very tiresome to say the least.

With anæsthesia produced by nitrous oxide, we obtain a suspension of muscular action, but no general muscular relaxation; hence, to suspend the function of the sphincters to such a degree as to remove the cause which prevented the healing of the ulcer, viz., the constant motion of the muscular fibres, we must exert a force which would be both detrimental and dangerous to our patient's welfare. Therefore, I cannot believe that this plan of treatment will be commended by the conservative surgeon.

Dilatation and incision. This method I believe to be a radical and unfailing cure for anal fissure, if skilfully and carefully performed. The following are the details of the operation: The bowels should be thoroughly cleansed by the previous administration of a dose of castor oil and an injection; after which, under ether-anæsthesia, the sphincters should be dilated in the manner previously described. The resulting hyper-distension of the anus not only affords rest to the parts, by the temporary paralysis of the muscles, but also, as pointed out by Van Buren, it stretches the sensory nerves of the anus, so that they cease for the time being to convey impressions, the result of irritation, to the nerve fibres exposed in the floor of the ulcer; in the same way that we find forcible stretching of the sciatic and the sensory branches of the fifth nerve relieves neuralgia.

Mr. Charles B. Ball[1] states that this theory of the temporary cessation of the function of the sensory nerves following the hyperdistension of the bowel receives considerable support from the fact which is frequently observed, that the first time the bowels move after the dilatation there is entire immunity from the pain which before was so severe.

The first step in the operation being accomplished—the dilatation of the sphincter—it will enable us to obtain a complete view of the lower end of the rectum and the exact limits of the ulcer. The fissure is now kept exposed by the fingers of the left hand, and a probe-pointed bistoury is drawn through its base, from within outward so as to incise the subjacent muscular fibres at right angles to their course. It is well to begin the incision a little above, and to end it a little below the ulcer, so as to insure its being carried quite through the sore.

Another method is that advocated by Mr. Syme, and is performed by transfixing the ulcer beneath its base with a small, sharp-pointed, curved bistoury, and cutting from without inward. This procedure endangers wounding the opposite side of the bowel unless it is protected.

The subcutaneous division of the sphincter, as recommended by some authorities, is not a satisfactory method, and is mentioned solely for the purpose of condemnation. It is not only uncertain in its results, but it is also painful, and in more than one instance has been followed by abscesses.

In cases in which the fissure is situated in the median line of the rectum, either anteriorly or posteriorly, care should be observed in making the incision, for the reason that wounds toward the coccyx split and separate the fibres of the external sphincter only, and are difficult to heal, while anatomical considerations will deter us from using the knife freely anteriorly: in the male from the bulb of the urethra being in close proximity, and in the female the shortness of the perineum, and the knowledge that division of the anterior fibres of the sphincter in women is

1 The Rectum and Anus, p. 136.

so frequently followed by incontinence of feces[2]

After any of these the patient should keep the recumbent position, and it is better to confine the bowels with opium, at least for the first forty-eight hours. After three or four days a laxative, followed by an enema, may be given, from which time daily alvine movements should be secured. In seven or eight days the patient can begin to move about, but for at least two weeks he should avoid standing too long on the feet. No dressing is required, except a small quantity of iodoform, which should be dusted over the ulcer, and the parts should be bathed well with warm carbolized water, night and morning, to remove offensive discharges.

Peroxide of hydrogen (Marchand's) may be used instead of the carbolized water.

In the majority of cases of fissure, healing progresses with great rapidity, but occasionally, after the wound has healed to a certain extent, healthy action stops, and the appearances of an anal ulcer are again produced. Should this occur, it will generally be found that some complication has been overlooked, such as a fistulous passage running from the ulcer beneath the mucous membrane of the bowels. The presence of such a passage might be suspected, if the discharge from the part is out of proportion to the size of the ulceration.[3]

Another complication consists of a small hypertrophied tag of membrane, or polypoid growth, situated at the base of the fissure, or on some other portion of the rectal wall.

The removal of these complications will aid the patient's recovery.

Society Reports.

LOUISVILLE CLINICAL SOCIETY.

Stated Meeting of Nov. 1st, 1892.

THE PRESIDENT, Dr. P. G. Guntermann, in the Chair.

PERITONITIS IN CHILDREN—CASES.

DR. J. A. OUCHTERLONY: I will mention a case that I have on hand at present which may become the subject of a laparotomy: A little girl ten years of age was perfectly well on Friday week ago. She went out to witness the parade which took place the evening of that day, and stood a long time on the damp ground; she experienced no unpleasant effects or unpleasant sensations of any kind that night, but the next evening, twenty-four hours afterward, she was suddenly seized with cramps and diarrhœa and had what seemed to be from the mother's account, an attack of acute intestinal catarrh. Sunday afternoon I was sent for, but being absent from the city, did not reach there until in the evening, when I found the child with rather profuse diarrhœa and slight fever, temperature 101° F. Under opium and bismuth she improved, but the fever did not go down, and since then the abdomen has become tumid and somewhat tender, the tenderness being more in the hypogastric region than anywhere else. She has a number of symptoms of peritonitis, but the bowels are freely open and the temperature is is not very high. She has no appetite and suffers a great deal from this tympanitic distension and tenderness; has a very high pulse, varying from 120 to 140 at times, and the question in my mind was, is that a case which would require or justify a laparotomy. The case has lasted ten days fully. There is evidently no obstruction; no vomiting; but the abdomen is characteristic of peritonitis; there is tenderness; there is dorsal decubitus; thoracic breathing; and while the temperature is not very high, there is that rapid small pulse which is so characteristic of peritoneal inflammation.

DR. A. M. VANCE: Do you think it could possibly be tuberculous trouble?

DR. J. A. OUCHTERLONY: There is no history of tuberculosis in the family either on the father's and mother's side, and the child was taken sick suddenly with acute symptoms. While she has not been narcotized by opium, it has been necessary to give it in order to relieve the pain.

DR. A. M. VANCE: Are the kidneys acting all right?

DR. A. J. OUCHTERLONY: She passes urine copiously.

DR. L. S. MCMURTRY: Does she seem to be growing better or growing worse?

DR. J. A. OUCHTERLONY: What little change there is, is for the better; pulse somewhat better, abdomen may be slightly

2 T. J. Ashton; Diseases, Injuries, and Malformations of the Rectum and Anus, etc., second American from the fourth English edition, 1865, pp. 49, 50.

3 Mr. Harrison Cripps; op. cit., p. 190.

less tense. Her expression is not that of peritonitis.

Dr. A. M. Vance; Did you find any worms?

Dr. J. A. Ouchterlony: No. She has had so much diarrhœa that if she had any worms they surely would have have been dislodged by this time.

Dr. A. M. Vance: It is certainly a very interesting case, and also a puzzling one. While the specific cause of this trouble cannot be located, I think there is one point about it:—If surgery is determined upon, an operation should be performed before it is done as a *dernier* resort, and in this way give the patient better chance of recovery from the surgery. I think oftentimes the patient's friends will only consent to having the abdomen opened in cases of this kind when it is too late to have any power left, on the part of the patient, to recover. I cannot imagine what the cause is, but it seems to me that it must be peritoneal trouble.

Dr. J. A. Ouchterlony: I felt that the necessity for a laparotomy might arise at any moment, and was deliberating in my own mind whether it was justifiable at the present time.

Dr. M. S. McMurtry: One anomalous feature the case presents is, that there is peritonitis and active diarrhœa at the same time opium is being administered. Peritonitis is nearly always benefited by diarrhœa, and it seems in this case like Nature was exerting herself in that direction to drain the peritoneum. Another feature is that we ought to be more cautious in deciding upon operative interference in cases of peritonitis in young subjects, than otherwise. It certainly would be a very nice point to know just what to do, and I think perhaps we have more responsibility in deciding when to interfere in the young subject than any other. I believe the course being pursued by Dr. Ouchterlony is the judicious one; that is, as long as the pulse is within a safe limit; as long as the child is well nourished and there is no evidence of obstruction, to watch the case closely and hold himself in readiness to interfere if there is any aggravation of the symptoms, or evidences of obstruction.

Dr. W. C. Dugan: One thing against peritonitis in this case, is that it began with diarrhœa: This seems to have been the initial symptom, rather than one which set up afterward. I am quite sure there is some peritonitis, but secondary to entero-colitis. The case may become one of appendicitis; one symptom, persistent pain, rather bears out the pathology of appendicitis, and it is probable there is a state of catarrhal appendicitis along with the general trouble in the intestines.

Dr. J. M. Krim: I saw for the first time to-night a case similar to the one reported by Dr. Ouchterlony, except that possibly in this case the trouble is due to impaction. A little girl about five years of age with several of her playmates ate a large quantity of walnuts last Sunday; at the time she was feeling perfectly well, and continued so all day yesterday, (Monday.) To-day the child began to vomit; has had no action of the bowels since Sunday; the mother gave her some castor oil and finally resorted to enema, without any result; the vomiting continued and when I saw her to-night the abdomen was apparently distended and very painful, particularly on the right side; she draws up the leg on that side so as to make her feel comfortable; temperature 102° F.

Dr. T. P. Satterwhite: Was there any induration or hardness in the right iliac region?

Dr. J. M. Krim: There seemed to be a little induration in the right side, but it may simply be an impaction of the nut in that region. Vomiting has not been stercoraceous at any time, simply substances which she has swallowed. I used the rectal tube, injecting about a pint and a-half of water.

Dr. A. M. Vance: It sounds more like a case of appendicitis than anything else.

Dr. L. S. McMurtry: In my opinion the trouble is most probably due to impaction, although it may be appendicitis.

Dr. W. C. Dugan: I would suspect appendicitis in this case owing to the localized tenderness, and tendency to favor that side, drawing the leg up, etc. I think the case is one that should be carefully watched.

AN EXPERIENCE WITH INTUBATION.

Dr. T. C. Evans: I had rather a novel experience about three weeks ago, in a case of intubation; patient, a child not quite three years old. Upon my arrival found the patient very cyanotic; the operation had been delayed until the last moment. I attempted to introduce a

tube used usually for patients three years of age, using the new O'Dwyer tube with double swell, but found I could not pass it without undue force and concluded to withdraw the instrument and insert a smaller tube. I withdrew the instrument and to my surprise the child ceased breathing. I had the Doctor in charge keep up artificial respiration while I was trying to screw on a smaller sized tube, but as the tube was a new one I found its obturator had a different thread from the screw on the applicator, so I had to go back to the three year old tube; meantime the child had not taken a respiration; had had a convulsion; the features relaxed; the jaw dropped and it was to all appearances dead. I introduced the larger sized tube, pushing it into the larnyx regardless of the apparent obstruction, and still the child would not breathe, and had no pulse. Artificial respiration did not seem to do any good, and I concluded to inflate the lungs by blowing in its mouth, which was very easily and quickly accomplished. After four or five inflations the child began breathing regularly. I found, however, that I had not only inflated the lungs, but had also inflated the stomach, and intestines as far as the large intestine, making the abdomen very prominent and tympanitic. A few minutes after the child was resuscitated, the air from the alimentary tract commenced passing off per rectum, and gave no further trouble. The after history of the case was that I removed the tube on the sixth day and had to re-insert it, no membrane coming away and the child had expectorated very little. On the tenth day I removed the tube again, when considerable membrane was thrown off. Dyspnœa returning I had to again re-insert it. On the fifteenth day I took out the tube. The patient is making an excellent recovery. I never saw a case before where the membrane was retained so long.

Dr. Wm. Cheatham: I have nothing to say in regard to the case, except to congratulate Dr. Evans on the result. I had a patient wear a tube nineteen days and get well.

INTRA-ABDOMINAL ABSCESS.

Dr. A. M. Vance: I was called by Dr. H. Goodman to see a lady fifty-two years of age, who had been sick with continual fever six and one-half weeks. She was taken ill suddenly at night and when the Doctor was called he found she had a sub-normal temperature. In twelve hours the temperature went up to 106 ½° F. Large doses of antipyretics were administered without any abeyance of the fever, so far as returning to normal temperature was concerned; it was reduced to 103° F., never going below 101° F. A few days before I saw the patient tenderness had developed in the left side, just in the loin. She was a very large woman, weighing at least four-hundred pounds; there was so much adipose tissue that nothing could be found by palpation except a slight flinching on deep pressure in the left loin. Following this high temperature she had three rigors. I determined that there must be an inflammatory process somewhere, and taking this tender part as my only guide, I made an exploration with a very long aspirator needle and found pus in the region around the kidney, and I determined to go after the pus the next day by the knife. I cut through about six inches of tissue and came to a cavity which was evidently near the kidney, and evacuated about a quart of very offensive pus, making the incision in the ilio-costal space. She was decidedly the largest person I have ever operated on, and the difficulties encountered from this amount of fat were great, as you could hardly tell where you were going, and it was impossible to get the patient in any position of advantage. I inserted two large drainage tubes, fully ten inches in length; washed out the cavity daily for four or five days, until pus ceased to flow in any quantity, and then removed the tubes because I could not get the proper gravity while they were inserted. She has done uninterruptedly well since the operation, the fever disappearing at once. She has had no interference of the renal secretions at any time.

Dr. L. S. McMurtry: I do not know that any remarks can be made, except to state that the case was very excellently conducted, as the results show.

STENOSIS OF THE LARYNX.

Dr. Wm. Cheatham: I saw a case about two and a half weeks ago with a history of stenosis of the larynx, which has been progressing for about six months, coming on gradually. The patient is a

child about two years and eleven months old. At that age we cannot make a laryngoscopic examination. I found no difficulty in introducing a tube beyond the stenosis, which entirely relieved the breathing. The tube was put in two weeks ago last Friday; I took it out yesterday, but had to re-insert it. I look upon the case as one of papilloma of the larynx, and probably will have to eventually open the larynx and remove the growth. There is no history of any specific trouble. I see Dr. Waxam reports a case in which a child wore a tube four years, and finally got well.

CASES OF COMPOUND FRACTURES.

Dr. W. O. Roberts: I had several cases of compound fractures that I intended to exhibit this evening, but for some reason only one of the patients has put in an appearance. They were all cases of very severe fractures with good results.

This is a man twenty six years old who works in a flouring mill, and who eight weeks ago had his forearm caught in the machinery. There were extensive contusion and laceration of the soft structures, and the bone was broken in a number of places. There were two wounds in the skin, one on the posterior surface extending from the elbow joint downwards for four inches, and one two inches long on the palmar surface. The arm was put up antiseptically and the wounds stuffed with iodoform gauze. Wounds healed without suppuration. I think he will have a very useful arm; you will observe there is very good motion both in the arm and fingers.

One of the other cases was a man fifty-five years of age, who had a compound Pott's fracture. The whole side of his leg was badly lacerated, and about four inches of the large bone protruded and stuck in the mud. I cleansed it as well as possible, cleansed the wound out thoroughly and put it up in the same manner as the first case reported, and the man has made an excellent recovery.

The third case was a compound fracture of both legs, occurring between the ankle and the knee. All of these cases have gotten along without any trouble, and they were all cases that I am satisfied would have been subjected to amputation before the introduction of antiseptic surgery.

Dr. W. C. Dugan: Do you expect complete flexion in the case exhibited?

Dr. W. O. Roberts: No, I hardly hope for complete flexion.

Dr. W. C. Dugan: The possibilities of asepsis in compound fractures is one of the greatest achievements of modern surgery. Many of you can recall a time when these lesions were looked upon as almost necessarily fatal. The surgeon felt when called to these cases that a calamity had befallen him. Since the introduction of aseptic surgery, these cases are sought after by the surgeons and the results are almost as favorable, if not quite, as simple fractures.

One word in regard to the use of gauze instead of drainage tubes: I believe gauze is far superior to tubes and should be used in all cases where it is possible to do so. I think in Dr. Vance's case it would have been better to have employed gauze instead of drainage tubes. I do not think there is anything equal to it.

I asked Dr. Roberts if he expected complete flexion for the reason that the upper end of the radius is dislocated anteriorly. This is a common complication. I should like to suggest that if complete flexion is very important, excision of the head of the dislocated bone above the bicipital tubercule.

Dr. L. S. McMurtry: Do you think gauze will drain away anything but serum?

Dr. W. C. Dugan: I do, I have used it often and with the most satisfactory result.

Dr. W. O. Roberts: I did the operation referred to by Dr. Dugan in an old case of anterior dislocation of the radius some time ago, with excellent results.

Dr. A. M. Vance: We can hardly hope to get the best results outside of the hospitals and infirmaries, until we educate the people concerning the value of asepsis and antiseptic dressings. I think this is a point that we all ought to make with the people, as it is an important element in our work. We should endeavor to educate the people so that when we apply our dressings, they will know how to conduct the case in our absence in a manner to produce the best results. I know I have had cases injured by meddlesome interference on part of the family changing the dressings, washing them off, putting on vinegar, turpentine, etc.

SUPPURATIVE OVARIAN CYST.

Dr. W. C. Dugan: I desire to report a rather interesting case I saw recently in Southern Indiana: The patient, a woman about thirty-two years of age, had a tumor of eleven years' standing in the left side; she was a delicate woman. She noticed this tumor after the birth of her first child. The tumor was then small and movable. As she changed position the tumor would move from side to side. It gave her little or no trouble up to about eleven months ago, when she was delivered the second time. She noticed that the tumor during this pregnancy had increased considerably in size, and differing from its former condition in that it had become fixed during the pregnancy. She suffered no great inconvenience from the tumor up to four weeks ago, when one morning she was taken with a severe chill followed by considerable febrile reaction. She had a number of chills every day, and considerable fever. The physician who attended her stated her temperature was 103½° F.; pulse 120; she was very feeble; lost flesh rapidly, being unable to take any nourishment, and vomited continuously. She had diarrhœa a good deal of the time. When I was called to see her, she was comparatively easy; had not had a chill for three or four days; temperature 102½° F., pulse rapid and feeble. She was very much reduced, weighing not to exceed seventy pounds, her natural weight being about 150 pounds. Considering the fact that she had chills and high fever, and sudden subsidence of pain, I took it there was a pus formation; did not think there was any doubt about it. If it was an ovarian cyst, we had the formation of pus in the sac demanding operation. When I saw her, pulse was 130, and hardly perceptible at the wrist; expression of the face anxious and haggard. She had that peculiar cachexia that all of us have often seen in cancers. She was told of the dangers of operation, and of the few chances she had of recovery. She said she wanted to be operated upon. She was put upon the table and an incision made in the left semi-lunaris. The peritoneum was found to be very much thickened and closely bound to the tumor, so I simply passed on into the cavity of the tumor and opened an abscess letting out a large quantity of very thick pus and broken down tissue. After evacuating the pus I washed out the cavity and started on one side to find how closely it was attached, and found it was adherent to almost everything in that region. I decided it was best to simply stitch the wall of this old cyst to the abdominal wall and tampon it which was accomplished in a short time, iodoform gauze being used to fill the cyst. The patient was taken off the table with hardly any pulse at all. I left her that evening. Her physician, a most excellent practitioner, agreed to see the case and remove the gauze the next morning and put in fresh gauze, and change the dressings every day. I heard from her two or three days afterward, temperature had dropped to normal, pulse to 95; she was able to take nourishment and retain it, and was doing well. I believe if I had attempted to remove the tumor, she would have died on the table. It was one of those cases of suppurative ovarian cyst, adherent to everything, so I simply stopped half way.

The point I want to call attention to in particular is the subsidence of pain when pus forms. I do not think this is fully appreciated by men who are not working in this line.

Dr. A. M. Vance: I remember assisting Dr. Cecil in an ovariotomy at the St. Mary and Elizabeth Hospital, tumor weighing twenty-five to thirty pounds, in which there was pus formation in an ovarian cyst, without any fever. It was a cold abscess, with no adhesions; the woman made a good recovery.

Dr. L. S. McMurtry: I think in these cases of suppurative ovarian cyst, the most common cause of the suppuration is a twisted pedicle. I have met with two such cases in the last month. When the pedicle becomes sufficiently turned to arrest the circulation in the tumor, it is very liable to undergo suppurative change.

Dr. W. O. Roberts: I should think had it been a twisted pedicle, there would have been gangrene of the tumor. I have seen one case of the kind.

Dr. W. C. Dugan: In regard to twisted pedicle:—Of course that was the first thing I suspected, but the adhesions were certainly of such long standing that it precludes the possibility of the pedicle being twisted. And, too, there was no indication of any interference in its circula-

tion, which would have existed had the pedicle been twisted.

Dr. J. A. Ouchterlony: The subject of laparotomy brings up a question upon which I would like to ask some information: In cases of perforation in typhoid fever, of course the only hope practically speaking, for the patient is to perform a laparotomy and excise the ulcerated portion and sew up the gut. I know it has been done, but do not know anything about the success that has attended this procedure. I would like to know if any of the gentlemen in the society have any information on the subject.

Dr. L. S. McMurtry: I believe Morton, of Philadelphia, has collected a series of all the cases he could hear of, and has done the operation several times himself—none of them successful.

Correspondence.

THE AMERICAN "CROWBAR AND SKULL CASE."

A correspondent of the Medical and Surgical Reporter writes us: While in Boston last summer I saw this skull and bar, and made the enclosed hasty sketch.

An article in Stone (*Vol. V., p. 493, 1892*), giving an account of the wonderful accident, prompts a description of this case which has gone on record as the most remarkable in the annals of physiology and surgery, while prominent physiologists are still unable to explain how the thing could have happened without causing death.

Phineas Gage aged twenty-five years, a native of Lebanon, N. H., was foreman of a gang of men, who were employed in blasting rock at Cavendish, Vt. Gage had never had a day's illness from childhood, and was as far as could be determined, perfectly healthy.

At the time of the accident, on Sept. 13, 1848, he was charging a drill hole for blasting and sat on a shelf of rock just above, but a trifle to the right of the hole, as he faced it. The powder and fuse were in position and he was in the act of tamping it in. He turned his head for an instant to look at his men at work behind him. His iron struck fire on the edge of the hole, an explosion followed and the tamping bar, 3 feet 7 inches long, ¼ inch at the small end, about 1¼ inches at the large end, weighing about fourteen pounds, was projected upward obliquely in the line of its axis, passing completely through his head and high into the air, falling several rods behind him, and was afterward picked up by one of the men, covered with blood and particles of brain. The man was thrown upon his back by the force of the blow and his extremities moved convulsively a few times, but he spoke in a few minutes. His men carried him to the road a short distance away and he rode home in an ox cart sitting up by being supported. When he arrived at his destination he got out of the cart himself with a little assistance, and an hour afterward walked up stairs with a little aid and laid down upon the bed where his wound was dressed. He was conscious but very weak from loss of blood.

The examination of the wound showed that the iron entered the left side of the face by the pointed end, immediately anterior to the angle of the lower jaw, passed obliquely backward, emerging in the median line, back of the frontal bone, near the coronal suture. The bones were broken in small fragments and forced upward and outward. The hole had much the shape of an inverted funnel, the edges of the scalp everted and the frontal bone badly fractured, leaving an irregular oblong opening in the skull 2 inches one way and 3½ the other, through which the pulsations of the brain were distinctly seen and felt.

The wound was dressed and the man showed no apparent signs of serious injury excepting a curious agitation of the legs, which were alternately retracted and extended. Then began a battle, the natural consequences of such an accident against the strong constitution of a healthy man. No one thought it possible that he could recover, but after a few days he began to improve and the fifty-sixth day from the accident the patient was up and walking

about the house and piazza. The sixty-fourth day he caught cold and serious consequences were, for a time, feared, but he recovered. Ten days afterward he was taken in a carriage and driven to Lebanon, N. H., a distance of thirty miles or more.

Gage passed the winter months in Lebanon, but returned to Cavendish the following April, carrying his iron with him. He was then in good health and flesh, but in his mind was weak and childish, and the sight of the left eye was entirely lost. He visited South America, passed some time in Valparaiso, then went to San Francisco, where his mother had moved. He died there of epilepsy, May 21, 1861, nearly thirteen years after the accident. The skull and iron are now in the museum of the medical department of Harvard University, and the illustration given herewith, shows the track of the iron through the skull.

ERYSIPELAS.

The mechanical treatment of erysipelas by means of strips of adhesive plaster is recommended afresh, by Wolffler (of Graz). This is applicable not only to the extremities, but also to the trunk, to the face, and hairy scalp (after shaving), and in its application makes a wall, obstructing the advance of the erysipelatous infection. Great care must be taken that the strips are so adjusted as to make a complete ring, and that the last applied do not relax the first put in position. To avoid relapses they must not be removed for at least four or five days after subsidence of fever and disappearance of the flush.

The statistics given by Wolffler seem very favorable, and the results are especially noticeable in the treatment of the facial cases. The cases of erysipelas in the lower extremities seemed to resist this method most stubbornly, which is also true of their resistance to the operative treatment proposed by Kraske and Riedel.

Should the treatment by plaster strips fail in these cases, we recommend the crisafication method.

Kroll (of Strassburg) adopts the same principle, but secures the end by the elastic compression of broad bands of rubber.

Gottstein (of Berlin) recommends that a one per cent. sublimate ointment, using lanolin for the base, be applied in thick layers twice daily, over all the erysipelatous and neighboring sound tissue. Over this a cotton dressing is applied.

Winckler (Bremen) advocates the treatment with oil of turpentine as suggested by Lucke. Several times a day (four or five times in very severe cases), the affected parts were well rubbed with oil of turpentine, using a brush, or wad of cotton.

Before the first application, thorough cleaning of the skin with ether, or absolute alcohol is advised. To avoid any dislodgement and dispersing of the germs, the friction should be made in the direction from the edge of the erysipelatous portion of skin toward the center. Over the diseased portion a cotton dressing is applied, and the application is renewed in from two, three, or four hours, according to the severity of the case.

The suspected point of entrance of the infection must be disinfected as thoroughly as possible, small ulcers cleaned of adhering crusts and covered with sublimate lanolin (one per cent.). Inasmuch as the use of turpentine is contra-indicated in cases complicated by albuminuria, the urine must always be examined before this treatment is entered upon.

Ichthyol, applied by von Nussbaum and Fersher in the Munich hospital, has been warmly recommended from every side; it is claimed to be a direct specific against erysipelas, which lessens the intensity of the disease and shortens its duration very materially.

It is usually applied as a salve (Ichthyol, Vaseline aa; or Ichthyol, Aq. dest., Lanolin aa,) two or three times daily on the erysipelatous skin, which has been thoroughly scrubbed with soap and water. Over this is laid a salicylated dressing and cotton. It is very important that the application be made not only on the actively inflamed skin, but also well out on the sound portion adjoining, and to continue it a day or two after the fall of temperature. * *

Ullrich (*Hosp. Tidende*) prescribes as follows:

℞ Ammon Sulpho ichthyol.....ʒ ss.
Ether Sulph.....ʒ ss.
Collod Elast.....ʒ i
Mix.

THE
Medical and Surgical Reporter

ISSUED EVERY SATURDAY

ADDRESS:

Care P. O. Box 843, Philadelphia

PENFIELD BROS., Publishers.

NOTICE TO CONTRIBUTORS.

We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

Terms. Five dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

Remittances should be made payable only to the publishers, and when in sums of five dollars or less should be made by Postal Note, Money Order or Registered Letter.

THE MEDICAL AND SURGICAL REPORTER.

SATURDAY, DECEMBER, 10TH, 1892.

THE HYDRIATRIC TREATMENT OF TYPHOID FEVER.

It is taught in the schools and accepted by the profession that, generally speaking, 70 per cent. of all cases of Typhoid fever recover without treatment; about 15 per cent. will die with or without treatment and the remaining per cent. are debatable and treatment may decide the issue of life or death.

The treatment of the disease by cold water baths has made but slow progress in this country. A heroic measure, violating preconceived notions of proper treatment, apparently impracticable in private practice, it has been compelled to prove its merits beyond question.

The method of Brand consists in the following systematic procedure:

Whenever the temperature taken in the rectum reaches 102.2°F. (39°C.) the patient is placed in a bath of 65°F. A compress, wet with water about five degrees lower, is placed upon the head, or water at a lower temperature is poured upon the head and shoulders. The patient remains in the bath fifteen minutes, during which time he is systematically rubbed by the attendants and encouraged to rub himself. At the expiration of that time he is removed from the bath, and wrapped in a coarse linen sheet, over which a blanket is folded, the extremities being thoroughly dried and rubbed. A little wine or spirits is then given. This is repeated every three hours, unless the temperature remains below 102.2°F. The alimentation is liquid, nutritious, and carefully regulated. No drugs are administered.

The most recent report of its efficacy in hospital practice is given by Dr. J. C. Wilson (*Med. News*, Nov. 26, '92). In the service of the German Hospital the total number of cases treated by this method to June 1, 1892, is 226; the total deaths, 12—5.3 per cent. In the entire series of 226 cases relapses occurred in 19 instances; more than 1 relapse occurred in 2 cases.

The statistics of the German Hospital now rest on a sufficient number of cases and extend over time enough to warrant conclusions as to the efficiency of the treatment in an American hospital. It has reduced the death-rate in this institution nearly 50 per cent. from the best showing of previous years, and 66 per cent. from the most favorable statistics of the hospitals of the city under other methods.

It is the custom at the German Hospital to administer to the patient upon admission, if before the 10th day, a laxative dose of calomel, from gr. vijss-x, and in cases entering the hospital during the first week this dose is very often repeated; otherwise,

the management of the cases in almost all instances conforms strictly to the method of Brand.

Such results enforce their own lessons. If it will do so much in hospital practice it will also improve results in private work. If convinced of its positive value the American practitioner will allow nothing to prevent its use in private work.

Translations.*

By MARIE B. WERNER.

Dr. v. Velits presents a study on Osteomalacia and its Treatment with a Report of Two Cases, (*Zeitschs. f. Geburts. und Gynaek.*, bd 23, Heft. 2). The studies of Litzman and Hennig, published in 1861, proved that 80 per cent. suffering from this disease proved fatal. Porro's operation performed in such cases always being followed by an arrest of the softening processes induced Fehling, in 1882, to conclude that simple castration might be followed by a cure of this disease. Sänger, although opposed to the Porro operation, also stated in 1884, that the removal of the uterus and its adnexa, usually brought about a cure of osteomalacia. Baumann, in 1889, collected a series of 44 Porro operations with 24 recoveries, all of which were also cured of osteomalacia. Of 12 conservative Cæsarean only 2 were finally cured. Fehling reported in 1890, at the International Congress, the results of his studies and presented as characteristics of this disease: 1st. Menstruation aggravates the disease. 2d. Pain in the affected parts is at once relieved by an operation. 3d. The blood vessels were found enlarged in the organs removed, possibly pointing toward the cause. The ovaries show no marked change in their stroma. 4th. Fertility is increased, pointing perhaps to an increased functional activity of the ovaries.

Fehling, therefore, concludes that the cause may be sought in the ovaries—their pathological condition influencing reflexly the vaso-dilators of the blood vessels in the bone.

v. Velits has found that it attacks all classes alike, either rich or poor, is uninfluenced by lactation and not always induced by pregnancy, since virgins have suffered from it. This latter is substantiated by Fehling who saw a case in a virgin, and Fruzzi who reports a case of 3 years' standing in a virgin of 34 years, similar observations have been made by Henning, Michnow, Hofmeier, and Thorn. In two of the five cases seen in virgins, the uterine appendages were removed, resulting in a cure in both. In Fehling's last communication he presented a list of 20 cases collected by him, which were treated surgically and cured. The author adds to this number, 1 by Hofmeier, 1 by Lihotzky, 2 by K. Braun, and 1 by Thorn; 2 by the author himself make in all 27 cures of osteomalacia by the removal of the uterine adnexa, on record.

The author agrees with Fehling that fertility is increased in those suffering from this disease, but his microscopical studies of the ovaries removed failed to show any abnormal enlargement of their blood-vessels.

Aside from those cured the author has two other cases under observation, which he intends to report later and also gives a synopsis of 4 cases found in the hospital records from 1864 to present date:

1. 1872, Primipara, æt. 41. Contracted pelvis due to osteomalacia, rupture of the uterus, escape of the fetus into the abdomen. Death followed shortly after section.

2. 1877, Primipara, æt 18, illness dating back to the 3d month in pregnancy. Osteomalacia, spontaneous expulsion of the fetus at the end of term—died from sepsis.

3. 1881, Multipara (4) æt. 34. Desired admission to hospital during 5th month of pregnancy, osteomalacia, premature induction of labor. Male, living child, gradual improvement after the puerperal period. 1885, she was again able to go without crutches. 1886, she conceived again, all the former symptoms of osteomalacia returned in a more aggravated form, permature induction of labor. Male child, died soon after birth, the patient again improved.

4. 1890, Multipara (7) æt. 31. The first 5 labors were normal. The sixth was a forceps delivery. Symptoms of osteomalacia set in during the sixth pregnancy, The pelvis was so soft and distended as to permit the seventh labor to be an easy one.

* Translated for Medical and Surgical Reporter.

The author found it interesting to study location as a factor in the cases, and has concluded that in the western and northwestern part of Hungary, the greatest number of cases have been found, especially, however, upon the Island of Shütt.

M. Runge, gives the following interesting reports from the Göttingen Frauenklinik (*Archiv. f. Gyn.*, bd 41). First patient, pregnancy complicated with a congenitally displaced kidney and an ovarian tumor, ovariotomy in the fifth month; artificial induction of labor, and delivery in the seventh month; both mother and child survived. This is the fourth case of congenital displacement of the kidney as a complication to labor. In two, section was performed, the kidney was found adherent to the upper border of the sacrum, having in this position effectually obstructed the normal course of labor and made the premature induction of labor an urgent necessity.

Second. Pregnancy in the presence of complete closure of the uterine os following amputation of the neck for epithelioma and repeated subsequent applications of the hot iron. Crucial incisions in the cicatricial tissue failed however, to give sufficient space to effect delivery, there being danger of rupture of the uterus, craniotomy was resorted to, especially since the heart sounds of the fetus had become weaker and diminished in frequency. Normal puerperium.

Third. Placenta previa totalis. Child fully developed. Version by the combined method, death from acute anæmia.

Fourth. Osteomalacia. Porro operation, intra-peritoneal treatment of the stump. Complete recovery, patient æt 45, ninth pregnancy; the first symptoms of osteomalacia appeared during the third pregnancy. Forceps delivery of the seventh child. Craniotomy on the eighth.

Fifth. Operation on a child of 16 hours for congenital umbilical hernia. The hernial sac contained some intestinal loops and a portion of the liver; the tumor was about the size of a lemon—reposition proved impossible, the incision through the integument was made about 1 cm. from the insertion of the amnion, then came circularly around the swelling, the sac carefully opened, the liver freed from its peritoneal adhesions, the wound closed with silver sutures. The child recovered.

A. Schmidt presents an interesting report of 9 cases for radical cure of hernia (after the method of C. Schwalbe (*Deutsch Zeitschr. f. Churg*, bd. 24).

Schwalbe's method of cure by means of injections of alcohol into the sac after the reduction of the hernia, had in the author's opinion, never received the attention it deserved. (Schwalbe reported 1000 with but one death, which was not directly due to the method).

The technique consists in first securing an aseptic field for operation, by thoroughly cleansing the parts. The needle is thoroughly sterilized, the hernia having been reduced, the left index finger is placed into the abdominal ring, thus enabling the operator to guide the needle into the canal. One to 2 c. c. are injected at one time; the first solution is 50 per cent. which may be increased gradually to 80 per cent., but must never exceed this latter.

The number of injections differ with each individual case. The alcohol produces localized inflammation which aids in closing the canal.

To establish a cure both patient and physician are recommended to exercise patience, the time may extend over three months. In femoral and inguinal hernia, Schwalbe advises strongly that the patients remain in bed the first three or four weeks no truss being allowed. Umbilical herniæ can be treated at the office, the opening made by the needle is closed by adhesive plaster.

Children are usually anæsthetized before the injection is made. Complications sometimes met with are enumerated as follows: Some injected fluid passing through the open sac into the peritoneum may give rise to acute pains for several hours, or the needle may wound the spermatic cord, which would produce a transient acute hydrocele.

The author's personal experience with this method consists of nine case—six umbilical hernæ, 3 in adults and 3 in children; 3 inguinal hernæ, 1 adult, 2 in children. A complete failure was met in a fat man having a large scrotal hernia. An umbilical hernia in a healthy man was improved but treatment was unfortunately interrupted. The remaining cases were all cured and the time since treatment ranges from 3 months to 7 years. These results were the author's incentive for call-

ing upon the attention of the general practitioner.

Abstracts.

A case of snake bite treated by hypodermic injections of strychnia, ending in recovery is reported in the October number of *The Indian Medical Gazette* by Surgeon-General Cadge and Surgeon Captain Pratt. A Hindoo boy, æt. twelve, was seen half an hour after having received a bite from a cobra in the great toe of the left foot. The only symptoms present were pain, tingling and numbness in the left foot; the body was cold; and the child seemed drowsy. A crucial incision was made over the site of the puncture, and the wound was washed out with a solution of permanganate of potash, and a bandage applied tightly above the ankle. Five minims of the ordinary pharmacopœal solution of strychnia was administered hypodermically, and repeated every five minutes. After the seventh injection the patient was seized with tetanic spasms, and vomited. Treatment was suspended for one and a half hours, when drowsiness again became marked; injections were again resumed at intervals of ten minutes. After the sixth dose (making thirteen in all) severe spasms occurred. During the intervals small quantities of brandy and extract of chicken were given. About seven hours after the snake bite the spasms ceased and the patient complained only of headache and tightness of the ligature on his leg. There was an increase of temp. (103°) for an additional eight hours, then gradually it declined, the patient making a good recovery. The authors have thought this case worthy of record for three reasons:

First, Because there is absolutely no doubt that the boy was bitten by a snake.

Second, Because there is absolutely no doubt that the snake was a cobra. We have the identical snake preserved in spirits. In how many cases of so-called "cure" of snake bite is there proof that the offending reptile was really one of the "Thanatophidia?"

Third, Because our patient recovered from the effects of the bite, plus the effects of ⅔ of a grain of strychnia introduced into his system by hypodermic injection. Whether the poisons were in anyway antagonistic to each other is another matter. Be this as it may, we shall have no hesitation in trying strychnia again should the opportunity occur.

[There is one other important point to be considered and that is the quantity of poison deposited in the wound, which rests chiefly on the number of stings inflicted previously on other subjects.—*Ed.*]

THE SPECIFIC TREATMENT OF ENTERIC FEVER.

In a paper read before the One Hundredth Annual Meeting of the Conn. Medical Society, Dr. Gustavus Eliot, strongly recommended a form of specific treatment, which embraces the use of calomel, in connection with the tincture of iodine and carbolic acid. In an experience of eight years with this plan of treatment, he has had the happiest results and uses none other.

The first requisite towards success is, to begin early, as soon as correct diagnosis is made. He commences treatment in every case, by giving ten (10) grains of calomel every other day until four doses are taken, also a mixture containing one drachm of carbolic acid and sufficient quantity of tincture of iodine to make four (4) drachms. Give patient four drops in a wine glass of water every four hours. To one who has been taught that cathartics should always be avoided in typhoid fever, this bold medication may seem reckless but the author claims better results than from any other plan.

He claims that the duration of the disease may be shortened and in some instances its course may be arrested. The treatment should be carried out at least ten days.

To the skeptical, he urges a trial of this plan, not in a single case but in ten cases. Trust not to memory, but keep a record and note results.

If desired, mineral acids may be prescribed, but be cautious of weakening the heart by use of the newer antipyretics. He does not recommend the distressing of the patient by plunging him in a cold bath.

TIC DOULOUREUX.

In the *Virginia Medical Monthly* for November, Dr John Dunn records a series of cases of inveterate tic douloureux, of years

standing, resisting all forms of treatment, which on closer examination proved to be of reflex nasal origin.

He says that, if in medicine, one form of treatment, be ever oftener wrong than another—and it is—or the conditions less understood, it is in the treatment of neuralgia: Is no disease, is there so often prescribed a "tonic to build up the system," as in this class of diseases. Whereas a thorough examination will quite frequently reveal the cause of the trouble to be due to some abnormal condition of the nasal cavities which can be easily removed.

The two most frequent causes of reflex trigeminal neuralgia, are, hypertrophied turbinates, and septal spurs or ridges. This painful affliction may also be reflex from other conditions than the nose: as from the eye, or ear.

Having a case which is dependent on these causes, of course the rational mode of treatment would be to get rid of the hypertrophied tissue, which can be done, by any of the approved methods. But unless the operator understands his business, or follows out the proper after-treatment, he will find his work of no avail. Having removed the hypertrophied tissue or spurs, he may have severe hæmorrhages, which become very annoying.

Varieties of plugs, etc., have been recommended for this condition, all of which he has found to be deficient. The most satisfactory intra-nasal dressing he has used, is cotton soaked in pure semi-solid Albalini: A plug is made of the desired shape and size and inserted in the nose: The Albaline effectually checks the tendency for the raw areas to send granulations into the cotton, and acts as a good hæmostatic. It can be removed at any time, and is not irritant.

The more one has to deal with neuralgia of the trigeminus, the more will we be convinced, that it most frequently results from some ocular or intra-nasal trouble, and that internal medicine should be the last resort.

TREATMENT OF CYSTITIS IN WOMEN.

In a paper read before the Missouri Valley Medical Society, by Dr. Crummer, he advises carbonate of lithium, in doses of five grains, or Londonderry lithia water and Salol in doses of from twenty to thirty grains thrice daily, in the acute forms of the disease. In severer cases, especially those found in the puerperal state, washing out the bladder with antiseptic solutions. In chronic cystitis the same treatment is of great service. The physician, must use caution in introducing the catheter, for purposes of irrigation, or matters will be made worse. The ordinary double current catheter is useless; better use a single catheter with a rubber tube and funnel affixed; clean, hot water is then poured in, until the bladder is full, when the end of the tubing is lowered and the fluid runs out, repeating this maneuver as often as necessary. For infection, resorcin, or boric acid is best, never using more than two or three ounces of solution at a time, lest harm result from over-distention.

Uterine displacements do not cause bladder irritations, as was formerly taught. It is generally due to pelvic inflammation. Especially is this true of gonorrhœal salpingitis, which must be relieved by operative treatment or otherwise, before irritation ceases. Tincture of Hyoscyamus or of Belladonna will give better results than Opium for the relief of pain.

Book Reviews.

Diseases of the Lungs, Heart and Kidneys, By N. S. Davis, Jr. A. M., M. D. The F. A. Davis Co., publishers, Philadelphia and London, 1892. No. 14. In the Physicians and Students' Ready Reference Series. Price $1.25.

This volume also comprises a part of the topics lectured upon, by the author. in the Chicago Medical College. The different subjects are described in a clear, concise manner, perhaps going to the extreme of stating what is probable rather than positively true. In his treatment of disease, the author gives explicit directions, as to the use of drugs calling particular attention to the exact time when a drug is indicated, so as to get its best effects.

The chapters devoted to asthma and pneumonia are full and complete. The author boldly states his opinions and gives his reasons for the same. While the prescriptions are given in the metric system, they are also written in the regular way. It is a well written work, fully up to date, and should find a place in the physician's library.

Diseases of Women, A manual of non-surgical gynecology, designed especially for the use of Students and general Practitioners, by T. H. Davenport, A. B.

M. D. Second edition, revised and enlarged, with numerous illustrations. Lea Brothers & Co., Philadelphia, Pa., 1892. Price $1.50.

In writing this book, the author states that he had two main objects in view, vis: "to give the student clearly, but with considerable detail, the elementary principles of the methods of examination and the simple forms of treatment of the most common diseases of the pelvic organs, and, to help the busy practitioner to understand and treat the gynecological cases which he meets with in the course of every-day practice."

The rapid advancement made in the knowledge and treatment of pelvic diseases caused the author to thoroughly revise and re-write the second edition, which is brought up to date in harmony with the present views, held by our popular teachers of gynecology.

The book is of more value as collateral reading than as a text-book.

Hygiene of the Sick Room, A book for nurses andothers, being a brief consideration of Asepsis, and Antisepsis, Disinfection, Bacteriology, Immunity, Heating and Ventilation, and kindred subjects for the use of nurses and other intelligent women, by William B. Canfield, A. M., M. D., Philadelphia, Pa. P. Blakiston Son & Co., 1012 Walnut St., 1892. Price $1.50.

This neat and useful work is the outcome of a series of lectures, delivered by this well known author before the University of Maryland Training School for Nurses.

Each disease is taken up in turn, as regards infection, and the methods of management of discharges, etc., are fully described. Several useful formulæ for disinfecting solutions are given, together with thorough instruction for the disinfecting, utensils, privies, etc.

The chapters on prevention of blindness in infants, and on ventilation are of special importance. The author endeavors to show the connection between bacteria and disease so that the latter may be prevented by destroying the former. While the book is mainly intended for nurses its usefulness can well extend into the physician's store of knowledge. The printing and get-up of the work speaks for itself.

Turpentine oil has been found to be a powerful deodorant of iodoform, particularly serviceable in removing the odor of that drug from the hands, spatulas, mortars, etc. Wash with a little of the oil, and, half a minute later, with ordinary oap.—*Merck's Bulletin.*

Periscope.

THERAPEUTICS.

MEMORIZING DOSES.

Dr. G. A. Wiggins gives the following rules:

1. The dose of all infusions is 1 to 2 ounces, except infusions of digitalis, which is 2 to 4 drachms.
2. All poisonous tinctures 5 to 20 minims, except tincture of aconite, which is 1 to 5.
3. All wines, from ½ to 3 fluid drachms, except wine of opium, which is 5 to 15 minims.
4. All poisonous solid extracts you can give ½ grain, except extract of calabar bean, which is 1–12 to ¼ grain.
5. All dilute acids, from 5 to 20 minims, except dilute hydrocyanic acid, which is 2 to 8 minims.
6. All aquæ, from 1 to 2 ounces, except aqua laurocerasus and aqua ammonia, which are 10 to 30 minims.
7. All medicated syrups you can give 1 drachm.
8. All mixtures, from ½ to 1 fluid ounce.
9. All spirits, from ½ to 1 fluid drachm.
10. All essential oils, from 1 to 5 minims.—*Pharm. Record.*

A NEW REMEDY IN DIABETES MELLITUS.

Professor Winternitz, of Vienna, recently drew attention to a domestic drug that he thought had been neglected. He related several renal cases that he had successfully treated by an extract made from the wild bilberry. His first experiments were directed toward the mucous membranes of the mouth, and finding it successful, extended his observations to the bronchi, bladder, and renal organs, where he met with equal success. He admitted having combined with the treatment the hydropathic applications, which were considered to have modified the avowed action and efficiency of the drug. Weil, of Berlin, has now added new testimony to the record of value attributed to this plant, in assuring us that it has acted in a wondrous fashion in apparently curing a young man of diabetes mellitus.—*N. Y. Medical Record.*

POISONOUS SYMPTOMS CAUSED BY EUCALYPTUS GLOBULUS.

Dr. Benjafield writes from Tasmania to the *Lancet:*

"I have been called in to cases of apparent poisoning by eucalyptus globulus, but all of them soon recovered. E. G.—, aged two years, climbed up to her mother's store of household medicines, and poured about a teaspoonful of pure oil on some sugar and swallowed it. Within half an hour she began to stagger. Then she became violently sick and lost all power over her legs, so that when attempting to stand she dropped down helpless. A sort of intoxicated torpor then set in. We could awaken her by shaking her and calling, but she immediately relapsed. The pulse was quick and strong; the pupils were slightly contracted. This lasted for about three hours, when she woke up perfectly right and ate a good meal. Another child drank an unknown quantity out of a bottle and had the above symptoms very marked; also had great difficulty in breathing; but, by report brought to me from the Bush, where it occurred, she recovered. From experience here, where we have never seen Asiatic cholera, I should expect it to be a good germicide and stimulant for this disease. It might safely be given in half-drachm doses, which would quickly saturate the system with the drug; or drachm doses in milk might be injected into the bowel."—*Md. Med., Jr.*

TREATMENT OF RINGWORM.

Crawford Warren, F. R. C. S. I., in the *London Lancet*, suggests the following treatment for this troublesome affection: The affected region should first be washed with soap and warm water containing a little carbonate of soda, and then well dried. Acetic acid should then be thoroughly applied with a small brush, and on the lapse of about five minutes, when the acid will have soaked into the part, an ointment composed of sixty grains of chrysophanic acid to an ounce of lanolin should be rubbed in. This treatment should be carried out daily for such a period as may be necessary.

ANTISEPTIC FORMULA.

Messrs. Christmas and Respant have endeavored to obtain a formula for an antiseptic solution that shall be powerful enough to destroy the microbes, and at the same time not so strong as to damage the organism.

The best results were obtained with the following formula:

℞ Acid carbolic..... 3ijss.
Acid salicylic..... gr xv.
Ess. menth. pip..... mx.
M.

A one-half per cent solution in water of this mixture destroys the microbes of diphtheria; those of typhoid fever cannot stand its action for more than half a minute. The anthrax bacillus is destroyed by a one-fifth per cent solution. This represents an antiseptic power five times greater than that of carbolic acid alone. Tuberculous sputa treated by a one per cent solution can be sterilized in a quarter of an hour.—*Weekly Review.*

PEROXIDE OF HYDROGEN IN INTESTINAL DISEASES.

Dr. Richards (*Med. Neuigkeiten*) has used this drug for twenty years. In carcinoma it removes the terrific odor, and, in combination with tannine, it reduces the secretions. Amongst other cases, the writer communicates one of ulceration (strumous) of the sacrum, complicated with adhesion and ulceration of the lower portions of the intestines and profuse suppuration in the rectum. At the same time the patient complained of an intolerable pain in this region, such as the author had never witnessed. Here a ten per cent. solution of the peroxide of hydrogen, with tannine and dilute hydro-chloric acid, gave the best results. Though the case ended fatally, the secretions and pain were easily controlled. In a case of chronic dysentery, with frequent dejections of thin, fetid stools, a solution of the remedy with tannine, injected high up into the intestine by means of a long rubber tube, once a day, produced at first discharge of pus or masses of pus and blood, and a cure in a short time.—*Med. Brit.*

COLD IN THE HEAD.

For cold in the head while in the acute congestive stage, there is no better remedy than gelsemium. One good large dose, say ten minims of the fluid extract, taken upon going to bed will effectually dispose of this troublesome and uncomfortable affection. One dose is usually sufficient. —*Medical Review.*

INFANT FEEDING.

A very important thing is the way the milk goes down into the child's stomach. The bottles are so constructed that the milk goes down too fast. Every child who sucks at the breast has to work for what it gets. One of the great troubles in artificial feeding is, the milk is cascaded into the stomach and immediately cascaded back again. Most of the sick babies are made so by some prepared stuff being cascaded into their stomachs in enormous quantities. Quantity is a great element in these disorders, and I have known too much food to make babies sick, even where the food was fresh milk.

I generally tell the mother to put a piece of pure, clean sponge into the nipple, so that the child must work with its gums and lips to draw the milk, and thus obviate the too rapid flow.—*Med. Era.*

CARE OF THE EYES.

Avoid reading when lying down. Sit with the back to the light or so the light will come over the left shoulder when reading, sewing or writing. When writing, should the light come from the right side, the shadow of the hand and pen or pencil falls on the paper, constantly shading the line of work and fatiguing the eye. Veils, especially spotted ones, are injurious to the eyes; and, if veils must be worn, they should be of the softest, clearest net. The eyes should be rested five or ten minutes after each hour's reading. The study of music and German is hard on the eyes, and the eyes should be rested more frequently and longer at a time when engaged in these studies. Avoid facing the lamp-light when studying. A bad stomach sometimes makes bad eyes. Attend to the digestion. Poor ventilation frequently weakens the eyes. When the eyes feel tired, bathe them with soft water, hot or cold, whichever on trial proves more comfortable. The hot water generally proves more beneficial.—*Ka. Med. In.*

In granulated eyelids, when the patient complains of dryness of the lids, the following treatment will give relief:

℞ Hydrarg. ox. flav..... grs. ij
Vaseline..... ʒ ss

M. Sig.: Apply a small quantity to the eye at bed-hour every night or every second night. When the ointment is too strong or too frequently applied at one time, the light will hurt the eye the next day.—*Kan. Med. Index.*

MEDICINE.

TYPHOID FEVER IN CHILDREN.

A. Moussous (*Arch. Clin. de Bordeaux*, No. 4, 1892) states that in a series of fifty consecutive cases of typhoid fever in children under the age of fifteen years he had only three deaths. He fully accepts the opinion that the disease is less serious in childhood than in adult life; there is less prostration, less hebetude, and seldom much diarrhea or pneumonia. At the same time the fever presents the same character as in the adult, and is often high—104° and even more; the pulse-rate is often also increased to 140, but this rapidity has not the serious significance which it would have in the adult, nor are complications so often observed. The disease, however, is more severe in infants under two years than in children above that age; this fact is called in evidence to support the view that one of the reasons of the comparative mildness of the disease in children is the activity of their digestive secretion, which tend to inhibit the growth of the pathogenic organism. Another reason he finds in the greater functional activity of the liver and kidneys leading to a more perfect elimination of the poisonous bodies produced within the organism during fever. On this head Moussous presents some new observations. Bouchard and others have shown that the toxicity of the urine is increased by typhoid fever, and that this toxicity persists for a varying period after defervescence, for as much as four or five weeks, when the disease is treated by the expectant method, for still longer if antipyrin is used. With the cold-bath method the toxicity of the urine is very high during the fever, but ceases quickly when defervescence has taken place (Roque and Weill); naphthol diminishes the production of the poisonous substances both during fever and during convalescence. Moussous finds that the toxicity of the urine in children suffering from typhoid fever is sometimes increased during the pyrexial period, sometimes at its close, but that in either case it becomes normal after a few days of freedom from fever. The elimination of the poisonous substances, therefore, in children who are treated by the expectant method, very nearly resembles elimination in adults treated by baths. Moussous does not recommend resort to

baths in the case of children, and notes one case in which serious syncope followed cold sponging. He advises the administration of laxatives every other day, a copious milk diet, and small doses of quinine.—*Arch. of Gynecology.*

SEXUAL HYPOCHONDRIASIS AND PERVERSION OF THE GENESIC INSTINCT.

Dr. Irving C. Rosee, of Washington, D. C., read a paper with this title, which was reported in the *Medical Record.* Omitting reference to such subjects as spermatorrhœa, venereal excesses, malformations of the genital organs, and the high degree of excitement often found among the insane, he limited his paper to the consideration of manœuvres of either sex to produce venereal orgasm independently of the conditions of normal coitus, and known comprehensively as genital abuse. Of all hypochondriacs of either sex, those who refer their sufferings to the genital organs, such as the onanists, nymphomaniacs, syphilophobes, etc., are the most miserable. It is an error to suppose that aberration of the genesic instinct is confined to our species, time, race, or latitude. Bestiality or sodomy has perhaps existed from all time. Juvenal mentions that monkeys were much sought after by women. A quotation from Plutarch indicates that there were relations between animals and human beings—men and women—in the Latin Empire. In our day this crime is less prevalent, though far from rare in large cities. The speaker mentioned numerous instances of sexual perversion which had come under the notice of the police in various cities in this country and Europe. A study of these cases shows that the question of sexual perversion is one of social hygiene touching mental pathology in many points. Lawyers and doctors and juries want to know whether such cases are criminal in their nature or are the result of insanity. Physicians recognize that continuous suggestion, or the reading of lewd literature, or excessive indulgence in fondling embraces under improper circumstances, etc., do effect the lower lumbar reflexes in such a way as to bring about sexual hypochondriasis, not to mention their influence as wide disseminators of immorality and as teachers of crime. Many of the methods of societies for preventing vice and bringing about prohibitory legislation as to vicious literature, etc., though well meant, are both reprehensible and impracticable. Overzeal leads to false philosophy and sophistry like that of the prohibitionists who would enact sumptuary laws. The treatment of such cases of unatural practices as have been referred to consist in prevention and education, with employment of proper medical and surgical measures. Self-control should be included, especially about the epoch of puberty. As an adjuvant nothing is better than gymnastic and athletic training. A verification of the judiciousness of this advice is often found in champion athletes, many of whom are temporarily impotent. —*Med. Age.*

RECTAL INJECTIONS.

The value of flushing the colon with properly sterilized water—hot, tepid, or cold—according to the special indications present, will be readily admitted in a long list of formidable diseases, some of which may be mentioned, as follows: Habitual constipation, with or without mental depression or active cerebral manifestations due to auto-infection, being so common, might be permitted to head the list; all occult nervous affections, associated or not with the uric acid diathesis, would naturally attract our notice, as it is well known that disordered innervation is generally conducive to the absorption of poisonous products from the alimentary tract. They are also serviceable in disease dependent upon pelvic congestion, such as uterine displacements, ovarian pains, and hæmorrhoids, for they contribute materially, though indirectly, to relieve the original cause, viz., hepatic insufficiency. In appendicitis, perityphlitis, and abscess, for which the *amœba coli communis* is now held responsible, they are invaluable.

Mild and even severe cases of dysentery and diarrhœa are often brought to a favorable termination without enemata, but it is safe to say that, with appropriate diet, all cases would be decidedly benefited, and many fatalities avoided, by the adoption of simple means. Enemata should find a place in the treatment of other disorders of this character, notably in the collapse of cholera morbus, yellow fever, and cholera, as well as in the conduct of cases of pleurisy or typhod fever.—*American Therapist.*

SOME INTERNAL USES OF CHLOROFORM.

In gastralgia with dilatation of the stomach; in the treatment of nervous vomiting; and of the vomiting of pregnancy, chloroform water in the dose of a small teaspoonful every half hour or hour is a very useful remedy.

In false croup employed in the proportion of one to ten drops in an ounce of water, to which is added a little glycerine; dose one teaspoonful every half hour; the effect is a very happy one.

In ulcer of the stomach small doses of chloroform given internally will often remove the pain and stop vomiting.

In the treatment of whooping cough three to six drop doses of chloroform in syrup will bring about very good results.

In the albuminuria and anasarca of pregnancy chloroform in twelve to twenty drop doses in sweetened water causes a rapid diminution in the albumen and the disappearance of the anasarca.—*Ex.*

MODE OF ACTION OF CALOMEL INJECTIONS.

P. de Michele, M. D., in a historical study of this subject, reproduced in *Merck's Bulletin*, thus summarizes his conclusions:

That calomel, administered by injections, is better tolerated, even in strong doses, than any other mercurial preparation, that it always produces in the tissues an inflammatory process with a subacute development, the final issue of which is a small residual and persistent cicatrix, that a dose of about 20 centigrammes of the remedy in a man requires for its transformation into albuminate and its absorption about 15 to 20 days; that iodide preparations administered at the same time by the way of the stomach accelerate considerably this transformation, so that they ought not to be used without great caution; that on account of its great efficacy, admitted at the present day by all clinicians, its moderate cost, and its capability for effecting the specific cure by two or three injections at long intervals without the least danger, the Scarenzio-Smirhoff method is not only a most valuable resource, but also one of the most important improvements introduced into anti-syphilitic therapeutics in the last thirty years.

HÆMORRHAGE FROM INTACT SKIN.

A Deriabin, of Osa (*Vratch*, No. 31, 1892, p. 784), reports the case of a previously healthy girl, aged eighteen, in whom there suddenly appeared, without obvious cause, a profuse hæmorrhage from the center of the tip of the nose, the anterior surface of the forearms, and the volar aspect of the finger tips. From the skin of the nose the blood escaped in the form of a single fairly thick stream, while from the upper limbs it ran in the form of numberless thin jets and drops, as if "from a watering-can." Sometimes the blood spouted in a jet more than a foot high, at others it simply oozed, while now and then the bleeding stopped altogether. The phenomenon lasted, with short intermissions, nearly four hours, and was followed by all the typical symptoms of acute anæmia (pallor of the face and mucous membranes, vomiting, giddiness, prostration, etc.), the girl gradually recovering in about four days. Careful and repeated examinations failed to detect any lesion of the integuments, except, perhaps, over the tip of the nose, where there could be seen "a largish orifice of a cutaneous gland plugged with a blood clot." The latter disappeared in a few days, "leaving a permanent bright red spot." The thoracic organs were sound, menstruation normal. The hæmorrhage did not recur up to the date of report (four months after the bleeding).—*Brit. Med. Jour.*,

---

SLOW PULSE.

Among the causes of slow pulse are the following:

1. Diseases or injuries to the nerve centers, producing either irritation of the pneumogastric or paralysis of the sympathetic (accelerator) nerves of the heart.
2. Diseases or injury of the pneumogastric nerve, increasing its irritability.
3. Disease or injury of the sympathetic nerves of heart, paralyzing them.
4. Disease of cardiac ganglia, by which the influence of pneumogastric nerve preponderates.
5. Disease of the heart-muscle (degeneration), whereby it fails to respond to the normal stimulus.
6. The action of poisons, as lead or tobacco, either on nerve endings or centers. The poison generated in salt fish.

Another possibility is *malarial poisoning.*—*Dr. D. W. Prentiss.*

THE EFFECTS OF ACIDS ON THE FUNCTIONS OF THE STOMACH.

1. Acids throw down a considerable precipitate of mucus.
2. They increase the cellular elements of the gastric contents.
3. Their introduction is followed by butyric-acid reaction, most marked after hydrochloric acid.
4. Larger quantities of the acids result in a considerable effusion of bile into the stomach.
5. They stimulate the secretion of pepsin, but have no influence upon the secretion of hydrochloric acid.
6. Their long continued administration is followed by marked diminution of the secretion of hydrochloric acid.
7. Even in large quantities hydrochloric acid produces no gastric disturbances. On the contrary, a continued administration of the acid is attended with a feeling of well being.
8. The difference in the effect between acids and the alkaline salt on the gastric functions consists in the fact that the alkaline salts dissolve the mucus and decrease the secretion of pepsin, while the acids precipitate the mucus and increase the secretion of pepsin.

The disappearance of the alkaline salts from the stomach is followed by a decided increase of the hydrochloric acid secretion. This does not occur, or only to a slight degree, in the case of acids. Both th eacids and salts, in large quantities in continued use, have the same effect in lowering the activity, and finally in destroying the function of the glands secreting hydrochloric acid.—JAWORSKI, in *Centralblatt fur Klin. Med.*

THE DANGER of gall-stones, as recognized by many observers, are as follows:

There is danger of exhaustion from the repeated attacks.

Fatal collapse from pain may occur.

Fatal jaundice may supervene.

Dropsy of the gall-bladder and danger of it rupturing.

Empyema of the gall-bladder.

Abscess of the liver.

Local peritonitis.

Perforation of the gall-bladder or gall-ducts, causing abscess, peritonitis, septicæmia.

Intestinal obstruction or hæmorrhage.

SURGERY.

A modification of Teal's rectangular flap operation is suggested in the *Medical Record*, by Dr. Robert J. Reed, whereby the length of the flaps can be materially reduced. It is in case of injury especially where most of the sound tissue is on one side of the limb that this operation is best suited. In Teal's operation the ends of the flaps are stitched together, and this requires the length of the short flap to be one-fourth the circumference of the limb where the amputation is to be done, while that of the long flap is one-half the circumferenee. The modification suggested is in the manner of coaptating the flaps. Each flap being in breadth half the circumference of the limb, and containing only skin and subcutaneous tissue, the short one extends only to the level of the sawn bone, the long one being in length one-fourth the circumference of the limb. The sides of the long flap are turned up and stitched to the end of the short flap at the center of which they meet, the length of the long flap being equal to one-half the breadth of the short. The end of the long flap is thus doubled on itself and stitched together. The suture line is then in the form of a T, the horizontal arm corresponding to the arm of the short flap and the perpendicular extending from the center of the short flap to the fold in the end of the long flap.

AN INTRA NASAL TUBE.

A method of holding the nasal bones or cartilages in place after fracture or operation wounds without interfering with nasal respiration has long been desired (*Lancet Clinic*). Dr. J. P. Gibbons has apparently filled the long-felt want. He recommends tubes of perforated metal so shaped as to fit closely in the nares. The perforations in the tube permit of the normal functions of the turbinated bodies being fulfilled at least in part. By putting a small sieve in the end of the tube pollen may be excluded without stopping nasal respiration In this way the doctor hopes to ward off hay fever in those subject to this malady. By doubling a rubber tube over the metal one, and filling the interspace with air or water from a syringe, epistaxis may be checked while breathing is still carried on through the nose. For

this last purpose a female catheter will do as well. For use after operations, if the perforated tube is as successful in the hands of others as it is in those of the inventors, it will be a valuable addition to the armamentarium of the surgeon.

SUTURING OF DIVIDED TENDONS.

Dr. A. H. Meisenbach (*Medical Fortnightly*) says: In the suturing of divided tendons, in order to obtain good results the following indications must be met: (1), The utmost care in carrying out complete aseptic and antiseptic measures. (2), Enlarging the wound to such an extent that a free field for operation is obtained; extensive opening of a sheath, if necessary, to easily catch up retracted tendons. (3), Care in suturing the corresponding cut ends with silk or catgut, preferably catgut. (4), The ends of tendons, if ragged, may be resected, so as to get smooth edges. If not enabled on this account to approximate the ends, with an intervening suture good results may still be expected. (5), Careful suturing of the sheath with continuous catgut suture leaving an opening for drainage at the site where tendons are sutured. (6), Appropriate position on a splint, the parts being so placed as to relax the sutured tendons.

OBSTETRICS.

INFANTILE PARALYSIS;—TREATMENT.

At first, according to Dr. J. Simon, external methods are used, slight revulsion over the spinal cord about the origin of the roots of the nerves, with dry cups or application of croton oil, mixed with some menstrum; or mustard leaves rather than cautery points and the other more painful methods of vesication. Next give stimulating baths (in bed), using vapors, etc. Thirdly, sedation of the nervous system by chloral, aconite, or conium. In the second week combine electricity with tonics as follows: Galvanization by weak continuous currents (2 to 4 milliampères). Apply the positive pole by slipping it on the shoulder, and put the negative pole in a basin of water slightly salted, into which the hand is put, use this for eight to ten minutes, and notice that the positive pole does not blister the shoulder. If it gets too red reduce the strength of the battery. Later use the faradic current as a change, but with weaker current. Slight massage and friction may be made also. Give the following.

℞ Tincture nux vomica..... 1 gramme
Tincture colombo, } āā 4 grammes.
Tincture cascarrillæ, }
M. S.: Give eight or ten drops as a dose.

In eight or ten days commence an arsenical treatment by a half to one milligramme of sodii arsenias.

During convalescence use sulphur baths or salt-water baths, or sea-baths, for three minutes at a time only.—*Arch. of Pæd.*

GYNECOLOGY.

PREGNANCY IN AN OVARIAN SAC.

Dr. Mackenrodt has recently shown to the Obstetrical and Gynecological Society of Berlin (*Prov. Med. Jour.*) a very interesting specimen of an extra-uterine gestation, which would formerly have been hailed as an undoubted specimen of that disputed species known as "ovarian pregnancy." It was from a patient who had been successfully operated upon for extra-uterine pregnancy. The gestation cyst was about the size of a hen's egg. In the lower part of its wall were remains of ovarian tissue and a large corpus luteum separated by a thin membrane from the general cyst cavity. The amnion could be defined above, and the chorion and placental rudiment were easily recognized. The fallopian tube and its fimbraiæ took no part in the formation of the cyst wall, for the unaltered fimbriated extremity projected completely within the cyst. Blood had entered the ostium externum and had formed a secondary hematoma in the tube. Under what condition, then, could a cyst be formed containing the ovary, the unaltered end of the oviduct, and also an ectopic gestation? The explanation seems to be as follows: The patient was the subject of that congenital condition which is called an ovarian sac or ovarian tube (the ovarial tube of German authors). This was first described by Richard in 1853, under the name of tubo-ovarian cyst, and it was supposed to be an ovarian cyst which had established an adventitious connection with the tube. But it is now held that in these cases the fallopian tube ends from the first in a peritoneal sac which also contains the ovary. Considerations drawn from comparative anatomy support this view, for a further exposition of which the reader is referred to Mr. Bland Sut-

ton's recent work. Under such conditions as the above there had developed in the case under consideration an ectopic gestation within the ovarian sac. Such an event is not unique, but in all other recorded cases the fallopian tube and fimbriæ have taken part in the formation of the cyst wall, rendering the true nature of the development much less evident. Hence the special interest of this case. No embryo was discovered in the case, and the cyst ruptured in extraction.

VULVO-VAGINITIS IN YOUNG GIRLS.

Contagion is the most frequent origin. Mechanical causes (onanism, oxaluria defloration) have been noted rarely. An eruptive fever, eczema, impetigo herpes of the vulva are sometimes the origin. The more frequent cause is contagion, not venereal, but of varied nature. A lying-in woman who has blennorrhagic discharge and who transmits a purulent ophthalmia to her new-born may give a vulvo-vaginitis to the child who sleeps with her or who uses the same toilet articles.—*Arch. of Pediatrics.*

NEWS AND MISCELLANY.

A NEW PROFESSORSHIP IN THE JEFFERSON MEDICAL COLLEGE.

At a meeting of the Board of Trustees held on Wednesday, November 30th, 1892, Dr. G. E. de Schweinitz, was, on the unanimous recommendation of the Faculty, elected Clinical Professor of Ophthalmology in the Jefferson Medical College.

At the time of election Dr. de Schweinitz was Professor of Ophthalmology in the Philadelphia Polyclinic and lecturer on Medical Ophthalmoscopy in the University of Pennsylvania.

A DIPHTHERIA EPIDEMIC CAUSED BY ICE

The Washington newspapers report the singular origin of an outbreak of thirty-two cases of diphtheria, of which fifteen proved fatal, that occurred in a small locality in that city. The body of a child that had died of diphtheria was packed in ice for two days, and when the body was transferred to the coffin, the undertaker threw the ice on the ground outside his shop. Three children were seen eating the ice, and in eight days they presented acute symptoms of diphtheria and died in a few hours. In all, thirty-two cases of the disease were ascribed to the deposit of the ice on the ground.—*Medical Review.*

PUBLIC DUTY OF PHYSICIANS.

Herodotus tells us that the Babylonians had no physicians, that when anyone was sick he was carried into the streets and placed where the greatest number of passers-by could see him; everybody was bound to stop and consider the case, and if an individual paused who had suffered in what seemed to him a similar manner, he was compelled to explain the method of his cure. There is no necessity for this sort of thing now, although a large section of the public enjoys nothing more than suggesting remedies for all sorts of complaints, and dabbling generally in a little physic. But there never was a time in the history of civilization when there was greater need that everybody should recognize the fact that he owes a medical duty to his neighbor which he is bound to perform.

Dr. George Gould recently delivered an address in Philadelphia on the subject "Everybody's Medical Duty," in the course of which he bitterly complained of the way in which the public at large leaves the medical profession to struggle under its Atlantean world of deputed responsibility. The indifference, the want of sympathy, to say nothing of the actual opposition experienced by those whose work it is to contend against disease, is as discouraging to our profession as it is disgraceful to our age of science. There never was a body of men animated by a spirit of devotion and self-sacrifice such as characterizes the medical practitioners of the age. How is this devotion and self-sacrifice recognized? The quacks, the charlatans, and the knaves make fortunes, while educated and conscientious practitioners are expected to do a large amount of work for nothing. Up to now the work of the physician has been the cure of sick persons. Now it has largely become the prevention of sickness. Patients will co-operate more or less in the work of being healed of their diseases, and are not wholly ungrateful to the healer, but those who are in daily danger of becoming patients will do little or nothing

to assist the men who are fighting to keep disease from their door. They laugh at bacteria and mock at microbes; carry the germs of disease in their clothes from house to house; sweep up the dust of the streets in their trailing skirts; take little or no pains to disinfect the excreta from such infectious cases as occur in their own homes; oppose with all their influence the erection of hospitals for infectious diseases in their midst, careless as to what becomes of the patients so long as they pass not by their own doors; impede the efforts of medical officers of health and inspectors of meat and other food to improve the hygienic condition of our towns and the quality of food we consume; disregard the authoritative condemnation of the corset, and in a multitude of ways help to make the work of the modern physician as hard as possible. Chaldea and Babylon could have taught this, at least, that everybody is bound to help the State to the utmost of his power in the battle against disease and death.—*British Medical Journal.*

Writing of the physician on the witness stand in the *New York Medical Examiner,* Austin Abbott, Esq., Dean of the New York University Law School, says: If a capable expert witness with strong convictions proves to be weak, or produces a weak effect upon the jury, it is usually because he does not get farther than the expression of mere opinion. The strength of a medical witness is not in the confidence of his opinions, but in the intelligible reasons he is able to give for them. The cogency of expert testimony depends on moderate opinions clearly supported by reasons intelligible to the jury. Of course upon many subjects the jury may not be capable of understanding, in a scientific sense of that term, the reasons for an opinion; but they are very quick to feel the difference between an opinion for which the speaker can state clearly reasons the character of which are intelligible in a popular sense, and one who has an equally confident opinion but is at a loss to make it clear that he has good reasons. Next after non-partisanship, clearness and lucidity in describing such matters as the jurors can distinctly conceive appears to be important, with the ability to give strong reasons, intelligible if possible in detail, and if not, intelligible at least in nature, for the conclusions arrived at. And lastly should be mentioned the freedom to make frank statement of the existing scientific doubts or uncertainty regarding any of the non-essential points in the case.

WOMAN'S PLACE

Lies not in medical paths, according to the American *Practitioner and News,* which goes on to say: That woman is capable of high education, and of doing practical work in science, and doing it well, no man with the record of her doings before him can deny. And if, when the schools are open to her, and she has duly qualified herself for medical work, medical privileges and medical honors are refused her, no one can doubt the injustice of the refusal. Nevertheless it is certain that, except in a few specialties, medicine offers no place to woman for her best work.

The rule is simple: no work benefits woman if in its pursuit she is compelled to unsex herself; that she must do this in medicine admits of no argument. This being the case, the men of the profession have nothing to do but to courteously open the door for woman, bow her in, and trust to the law of the survival of the fittest for the consequences.—*Med. Review.*

A Complicated Case.—One of our physicians recently received the following letter from a country physician (?): "Dear dock I hav a pashunt whos phisicol sines shoes that the windpipe was ulcerated of, and his lung have dropped intoo his stummick. He is unable to swoller and I feer his stummick tube is gon. I hav give hym evry thing without effeckt. His father is welthy Onerable and influenshial. He is an active membber off the M. E. Chirsch and god nos I dont want to loose hym. what shall I due. ans. buy returne male, yours in neede."—*Ex.*

Like Other Folks.—Clem—"How's de doctah gettin on, Rastus?"

Rastus—"He ain't no bettah, Clem, an' he had to call in a brudder physician."

Clem—"Why don't he cure himself?"

Rastus—"Kase doctors is jes like other folkeses; wen day's sick dey's got ter hab a physician and when dey ain't sick dey kin cure derselves—"

Dr. Charles L. Dana has made a very careful study of 614 male alcoholics treated at the Bellevue Hospital. He believes that strychnine has a certain degree of specific effect in inebriety and in alcoholic intoxication. In acute alcoholism, when the system is overwhelmed with the poison, one-sixtieth of a grain every two or three hours; in the chronic form, it should be administered in good doses for a considerable time. In ordinary acute delirium of alcoholism, twenty to forty grains of chloral, repeated in smaller doses in two or three hours, and combined with digitalis and strychnine, is the safest and surest means of controlling the excitement and securing sleep. A preliminary laxative, and a careful diet of hot milk and beef tea with red pepper should be insisted upon. In febrile delirium tremens, depressants must be used with care; cold baths or cold wet-packs, with friction, must be applied every two or three hours while the temperature remains high. Hypodermic injections of morphine are rarely needed, and he does not advise them.—*New York Medical Record.*

Biggs—Speaking of long lives, I had an uncle on my mother's side who lived to the age of ninety-nine.

Diggs—Oh, that's nothing! My aunt Sally Smasher didn't die till she was past one hundred and eight.

Young Man in the Corner—I had a grandfather who beat that record all hollow.

Biggs—When did he die?

Y. M. I. C.—He didn't die at all. He's alive yet.

He Hadn't Taken Anything.—"Have you taken anything for your influenza?" asked the doctor of a long, lank, hungry-looking man who came to him complaining of being "all run down," his appearance verifying his words.

"Well, I ain't been takin' much of anything, doctor—that is nothing to speak of. I tuk a couple o' bottles o' Pinkham's bitters awhile back, an' a bottle o' Quackham's Invigorator, with a couple o' boxes o' Curem's pills, and a lot o' quinine and root bitters my old woman made up. I 've got a porous plaster on my back an' a liver pad on, an' I'm wearing an electric belt an' takin' quinine and iron four times a day, with a dose or two of salts ev'ry other day. 'Ceptin' for that, I ain't takin nothin'."—*Ex.*

Human Nature.—A little boy of four years has for some time had a habit of waking about midnight and calling for a drink of water. At last his mother told him that she would not get up any more to wait on him; that she would put a pitcher of water and a glass on the stand near his bed, and that if he wanted water in the night he must get up and get it himself. She placed the water on the stand in his sight and left him. That night, at the usual time, she heard the boy's call—"I want a d'ink o' water! I want a d'ink o' water!" But she paid no attention. He called two or three times, and after he had whimpered a bit she heard him get up and thump along the floor to the stand. And through the darkness came this very positive ejaculation. "I hope I thpill every jam jop."—*Med. Review.*

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY FROM NOVEMBER 27, 1892, TO DECEMBER 3, 1892.

The leave of absence granted Major John C. Skinner, Surgeon, U. S. Army, on account of sickness is extended six months on account of sickness.

Captain Henry P Birmingham, Assistant Surgeon, U. S. Army, is relieved from duty at Boise Barracks, Idaho, to take effect upon the expiration of his present leave of absence, and will then report in person to the Commanding Officer, Fort Grant, Arizona Territory, for duty at that post.

By direction of the Secretary of War, paragraph 3 of Special Orders, No. 232, October 3, 1892, from this office, directing Major Robert M. O'Reilly, Surgeon, U. S. Army, to report for duty as Attending Surgeon, in this city on December 15, 1892, is amended to direct him to so report, on January 15, 1893.

The ordinary leave of absence granted Captain Eugene L. Swift, Assistant Surgeon, U. S. Army, is changed to leave of absence on Surgeon's certificate of disability, and extended as such two months.

The extension of leave of absence granted First Lieutenant Samuel R. Dunlop, Assistant Surgeon, U. S. Army, and further extended one month.

So much of par. 2. S. O. 232, A. G. O. October 3 gr. as directs Captain Junius L. Powell, Assistant Surgeon, U. S. Army, to repair to Fort Monroe, Virginia, for duty at that post, is revoked, and he will upon the final abandonment of Fort Randall, South Dakota, report in person to the Commanding Officer, Jackson Barracks, La., for duty at that post, relieving Captain William C. Borden, Assistant Surgeon. Captain Borden on being relieved by Captain Powell will report in person to the Commanding Officer, Fort Adams, R. I. for duty at that post.

Major William M. Gardner, Surgeon, U. S. Army, is relieved from further duty at Angel Island, California, and will report in person to the Commanding Officer, Fort Keogh, Montana, for duty at that post.

Pharmaceutical Products of the Farbenfabriken vorm Friedr Bayer & Co

Sulfonal=Bayer

induces sleep, free from narcosis, and sequelæ. It acts purely as a hypnotic and claims no analgic powers. Sulfonal is also of the highest value in the neuroses and is largely employed by neurologists. It is a safe remedy and its continuous use does not give rise to a drug habit. Sulfonal must be given according to directions. (*Supplied in ounces.*)

Salophen

is a new salicylo-phenolic derivative said to be so combined, chemically, as to constitute a safer and more effective remedy than either of its components, or any analagous preparation. The reports refer in the highest terms to its value in rheumatism and allied affections. Competent observers recommend it for extended trial. (*Supplied in ounces.*)

Europhen

is a complete substitute for iodoform and is a cicatrisant of special value in specific lesions, catarrhal and ulcerative diseases and all surgical conditions formerly treated by the latter preparation. It has five times the covering power of iodoform and forms an impervious coating over denuded tissues. Europhen has a faint, agreeable odor resembling that of saffron. (*Supplied in ounces.*)

Phenacetine=Bayer

continues to justify the high praise of physicians, and it may properly be considered as the best of the modern antipyretics and anodynes. In *la grippe*, rheumatism, migraine, neuralgia, etc., it is a prompt, safe and effective remedy. Phenacetine, unlike the secret mixtures announced as analgesics and antipyretics, is a true organic derivative. (*Supplied in ounces.*)

Aristol

is now widely used as an agreeable and effective dressing in all of the operations of major and minor surgery and in dentistry. It is invaluable in ulcerations of all kinds, and in burns, blisters and bed-sores. It adheres closely to mucous membranes and wound surfaces. (Aristol and "Europhen-Aristol," a combination of both remedies are supplied in ounces.)

OBJECT LESSONS IN GYNÆCOLOGY.

By W. H. LINK, A. M., M. D.,
PETERSBURGH, INDIANA.

III.

CONSERVATISM IN GYNÆCOLOGY.

In country practice, "conservatism" and ignorance are synonymous terms. In cities like New York or Philadelphia some, teachers even, are known who arrogate to themselves the title of "conservatives," and pose as beacon-lights warning the inexperienced to avoid the dangers of heroic procedures. Upon closer view these men are usually found to be awkward and clumsy surgeons whose mortality, when they do operate, is very high as compared with their more skillful competitors. In order to avoid invidious comparisons, they turn away from all surgery possible and seek to hide their incapacity behind a sonorous title. This title they hope may convey to the unwary or the weak, an idea of abstract superiority in themselves combined with a most laudable solicitation for the interests and the safety of their patients. Such a combination of qualities they are most unwilling to concede to any whose success impel them to a course which leaves timidity shivering in imaginary grave-yards; a course compelled by experience because it finds ignorance plodding along beaten paths, learning nothing from the fate of those confiding victims of false diagnosis or delayed therapy whose whitened sepulchers, like milestones, mark the progress of "conservatism" along its chosen road. If there is any one thing in medicine that we country doctors do know the height, depth, length and breadth of, it is "conservatism" so miscalled. The word is dinned into our ears so much, held up before our eyes so often, that we sometimes suspect that one of its attributes will some day be found to be the long sought-for fourth dimension. Then our knowledge will be equaled only by our self-sufficiency, and he who foists anything new or bold upon us will be made to pay the penalty by having it first tried upon himself.

While we say that among us ignorance and "conservatism" are convertible terms, it must not be forgotten that there are two kinds of ignorance. When one makes every effort possible to keep in touch with the advanced thought and the most recent discoveries in the profession to which he belongs, and when his knowledge is only bounded by his opportunities, the severest tribunal extant will acquit him of the charge of culpable ignorance. Should his *conservatism* consist in standing by known truths and tried methods till better ones come his way, then the word in its meaning lies very close to wisdom. The country doctor, living far away from the great centers of medical thought and often existing only as a tangent to the great circle of medical knowledge, cannot accept for himself crude and unsettled theories or methods not backed by a very great success. For this reason he is the only true *conservative*—holding fast to all that is good and shunning what time, opportunity and experience have shown to be evil. Pope's couplet on the use of words is his chosen motto: "Be not the first by whom the new is tried; nor yet the last to lay the old aside." His antithesis is one who, having eyes, sees not, and having ears, hears not the things with which genius or perseverance is daily enriching professional knowledge. To tell him of something new or striking is but casting pearls before

swine. Instead of accepting as a blessing or as tidings of great joy, some newer method of surgery or some improved theory or newly-discovered fact in medicine, he only intensifies the darkness of his own blindness and deepens the shadow of his own ignorance by decrying the newer light of his more progressive brethren. He at once becomes proud of his ignorance. The world of medicine and surgery in his eyes holds but two camps, the "conservatives" and the inexperienced. In the first belong himself and all, who, like him, look upon the science of medicine as a closed book which it would be sacrilege for any one to add to or take from. He silences criticism and confounds argument by his constant reference to *his experience.* The greatest truths may be daily set before him, but they fall on unheeding ears. In such a man the obstinacy of youth has become the stupidity of age, and opportunities which might have brought improvement "have passed away and left no shadow of their loveliness on the dead waste of life." Envy of his more progressive contemporaries fills his heart with bitterness; and when he writes he dips his pen in the ink of detraction; while, his cowardice alone forbidding him to identify the object of his malice, covert innuendo and weak insinuation sputter on his written page like feeble glimmers from an exhausted tallow dip.

Conservatism of the better kind; that is *conservatism* which waits till questions are no longer debatable, and holds fast to that which has proven good till something better appears to take its place, which looks to the experience of the great hospitals and the general consensus of opinion to settle doubtful subjects of discussion; is commendable among the great army of country practitioners.

For the very reason that we all look to the cities, their teachers and writers, as guide-boards along our great professional highway, they should point forward not backward. A guide-board pointing backward may show us the way over a very good road, but it is one that has been pressed by our weary feet so long that we need no direction to find our way. A teacher living in a great city, surrounded by hospitals and dispensaries, spurred on by the magnetism of emulation, must, if he would retain our confidence or merit our respect, be among the first to show us the excellence of any new procedure, or of any great truth which has suddenly assumed proportions of importance When individuals so situated fall behind and begin to rehash old and abandoned methods, because their skill is unequal to the task of grasping with the new, great damage is done among men who accept their teachings. It is so much easier for everybody to go along as they have been accustomed always to do, than it is to learn and practice something new. Thus the old iodine, glycerine, hot douche, opium, poultice and tampons, are still prevalent in the hands of country doctors and the obstinately "conservative" city practitioners who whitewash the vaginal vault with a variety of medicaments for the cure of the various forms of tubal disease. Such a line of treatment being even yet set forth in most of the latest text-books. And men who have foisted upon the profession weak and puerile literature are daily adding to the mischief wrought by their books by filling the journals with a lot of the same kind of diluted nonsense. The honestly *conservative* or conscientious country doctor, reading both sides, is "betwixt the devil and the deep sea" until self-enlightened by his own experience. But while he hesitates his patients are lost. To illustrate the evil effects of bad literature and false "conservatism," I shall give a few short histories of the evils of delay, bad therapy, incorrect diagnosis, and mistaken pathology, as they have occurred within the last ten years in this county and as they have come under the observation of either my preceptor, Dr. Byers, or myself.

Case I. Mrs. B., married, mother of 4 children. Had an attack of pain in bowels, followed by complete obstruction. Dr. B., the attending physician, and at that time the leading practitioner of the county, diagnosed concealed hernia, gave a fatal prognosis, and called for counsel. Dr. B—r., an able physician from a neighboring county, was called. He concurred in the diagnosis and treatment, which under the "conservative" teaching of the time, was opium, fluid diet and rest. Fæcal vomiting supervened and, after lingering for more than a week, the patient died. At the post-mortem it was found that a knuckle of intestine had fallen through a tear in the broad ligament and, becoming strangulated, had produced all

the symptoms complained of, and been followed by death. The hernia was easily reduced at the post-mortem and the gut was not gangreneous. By a timely section she could have been saved. The bowel could have been lifted out, the rent in the ligament sewed up and the patient been left in as good condition as before. The diagnosis was arrived at by exclusion and was brilliant enough to satisfy the most critical; but the influence of the text-book lore, the absence, at the time, of any positive literature advocating the practice of abdominal section, led both of these physicions along the "conservative" track and a useful life was lost.

Case II. Mrs. H., mother of a large family of girls. Had suffered for a long time with pelvic abscess. She finally became very sick and the attending physician informed the family that if the pus burst into the bowel she would get well, otherwise not. At last the collection on one side did open into the bowel and she became better; but soon the abscess on the other side grew worse than before, and again the only hope held out was, that it might open into the bowel. But instead, it opened into the peritoneal cavity and she died in a few hours. This case offered a most brilliant opportunity for good surgery. Double pyosalpinx with ovarian abscess. But at that time such operations were not known out in the country. The teachings of Tait had not yet penetrated the back-woods, and the eminent men, who now so ably set forth the science of abdominal surgery in this country, had not yet found their voices. The men who furnished the literature for country doctors to read and ponder, prided themselves on being great head-lights of "conservatism" and taught that all abdominal work was necessarily fatal unless done in their private hospitals, while their statistics showed that most of it done there was equally fatal. Joseph Price, with his 123 sections done in courts and alleys and over livery stables, WITH BUT ONE DEATH,— had not yet knocked the wind out of the self-inflated gas bags who had been for years flooding the market with padded text-books and advertising private hospitals for abdominal work.

Case III. Was called in counsel, very early in my career as a physician, to see a lady, Mrs. T., 30 years old, mother of three children. Found her, as the attending physician said, suffering from peritonitis. She had great pain in the pelvis, a very sore belly, a high temperature and a very rapid and feeble pulse. She would not permit a digital examination because she said, "it hurt her so much she could not stand it." We had no trouble to decide that she had "idiopathic" peritonitis and that she needed stimulants and plenty of opium. It took a large amount of the drug to keep her quiet but we did not reach the limit of Alonzo Clark by a good deal. She kept growing worse for three days when she died. This, in the light that I now have, was a case of tubal disease with leakage and resulting peritonitis. A section would have saved her, but "conservatism" let her die. I do not feel culpable, for we acted according to the latest text-books; and the literature in the journals, that threw any light on the subject at that time, was scarce indeed. Whenever any man, a little in advance of the rest, did advocate surgical measures for the relief of such cases a dozen old fogies lifted up their voices in favor of hot water, opium, and such other tinkering palliations, until the country doctor was perforce, led to believe that the surgeons were veritable Jack the Rippers with mutilation only as the end of their efforts and the result of their work.

Case IV. O. L., girl; 16 years old; in the practice of Dr. H., attacked with sudden pain in bowels which rapidly developed into a well marked case of peritonitis of the "idiopathic" variety. Opium, diet, and rest were prescribed, together with stupes to the surface of the abdomen, with the usual "conservative" result— death. The doctor says that, with the light he now has, he is enabled to say that she had an attack of peritonitis due to appendicitis, and that a section would have saved her. But the old "conservative" teaching of both books and journals and from lecture rostrums in various medical schools, was thundering against anything like boldness especially in the country doctor who had no *private hospital.*

Just here, although not gynecological cases, I may with propriety quote the results of a few cases of appendicitis in men, because the subject comes under the head of abdominal surgery and gynæcology without abdominal surgery becomes nothing more than vagina-swabbing. There have been four deaths from appendicitis,

within the last six years, in this county. Every one of these cases was a good subject for surgery and all were sent to death by the old opium, poultice, do nothing plan. This state of affairs is to some extent yet going on, not only in this county but in every other county in this state, and I have no reason to believe that Indiana is behind other states in the scientific knowledge, boldness and skill of her medical men. People are dying by the thousand for want of the timely application of surgical means, and in view of this I wish to close with the statement I made at the end of lesson II: "There are too many operations by the few and too few by the many."

REPORT OF TWO CASES OF NEPHRECTOMY—RECOVERY.*

By LEWIS G. NOLTE, M. D.,
MILWAUKEE.

Surgery of the kidney has always been a subject of interest, but more especially during the last two decades. It has been of interest because during that time more has been done than ever before to elaborate plans of diagnosis in diseases of the kidney, especially for diseases of an inflammatory and suppurative character, and, if necessary, extirpation of this organ, when found diseased in such a way that radical means were called for. It was our own surgeon, Dr. Wolcott, now deceased, who first extirpated the kidney; but he did not know that he had removed it until after the operation. He had extirpated the kidney with a cancerous mass, unknown to himself until afterwards. The patient died on the fifteenth day.

The operation nephrectomy was, however, first resorted to intentionally by Simon, of Heidelberg, in 1869. From that time until 1884, when Weir, of New York City, published an able review in the *New York Medical Journal* entitled: "Extirpation of the Kidney," one hundred and fifty-two cases of nephrectomy had been reported.† Since then so many cases have been reported that it may be said that the operation is no longer a rare one. Nephrotomy is still more frequently performed; probably because less difficult. Still, I am sure, the two cases I report will be of interest.

Case I. P. R., aged thirty-three; M; United States; carpenter; family history excellent.

Although a carpenter by trade he had been doing the duties of shipping-clerk in a stove concern for the last seven years. Had always been well and, indeed, very strong until five years ago when he began to suffer pain in left side and loin. He noticed that he was losing flesh and strength but continued to work. As time rolled by he had to pass his water more frequently than usual until finally it became an annoyance to him. The urine became cloudy and ill-smelling; never had noticed any "gravel;" never had cystitis, or gonorrhœa, or any other venereal disease. He continued in this way until in the middle of June, 1889, he was taken down permanently, when, he states, he had lost at least forty pounds. He had been treated for lumbago, indigestion and lastly for typhoid fever with peritonitis. His urine had never been examined, he said. His last physician had treated him until a few days before I saw him, and his last explanation was that *the typhoid fever had settled in his left kidney.*

I was called to see him September 7, 1889.

When I first saw patient he was in bed. He looked very pale, emaciated and anxious. He complained very loudly of pain even when quiet, although he tossed about a good deal on account of it, for he was delirious at times. His temperature was 104° F.; pulse 128 and feeble; tongue furred, brown and dry. I was informed, that although almost three months had elapsed since he had to go to bed, he had hardly slept any. He was indeed in a "typhoid condition." but it was not typhoid fever. There were besides symptoms of typhoid fever, others both objective and subjective.

He had had for some time past pain with, but more especially after, micturition. There also had been a frequent desire to micturate. The urine was described to me as having been, and being now, pungent and cloudy; very little was passed at a time. He had had diarrhœa

*Read before the Milwaukee Medical Society, November 8, 1892.

†Weir, extirpation of the kidney—*New York Medical Journal*, No. 26, Vol. XL.

until three weeks ago, since which time he has been absolutely without any movement from his bowels. When he had the afore-mentioned diarrhœal movements he he would at times, not always, experience great pain in the abdomen, radiating from the left loin. At other times he had pains, described as dull and gnawing in character, always referred to the region of his left kidney and radiating therefrom. On examination I found left thigh well-flexed on pelvis; could not be extended without pain. The abdomen was moderately distended and tympanitic all over except toward the left loin where there was dullness. Abdomen was somewhat sensitive to pressure. In the left lumbar region there was considerable bulging, in fact, so much of a tumor that one could not help noticing it. It seemed to fluctuate.

In view of the fact that there were such clear indications of an inflammatory disease or the result of it—abscess, I did not hesitate one moment to insert an aspirating needle. The point of the needle had gone in about two inches, however, before any pus was drawn into the aspirator. Of course, the presence of pus settled the diagnosis, or, better, the means of getting rid of the pus. I at once decided to perform nephrotomy, or, if necessary, nephrectomy. The patient was very weak and anything that was to be done had to be done soon. So it was decided to operate next day although Sunday.

Operation: The patient was weaker than ever, having spent a bad and restless night, pain having been very severe. Temperature 103° F.; pulse 130 and feeble. He was in a pitiable condition indeed. It was decided to go ahead, however, and do what we could even if nothing more than a puncture of the abscess-sac resulted.

Ether was administered after patient had received a copious draught of brandy. I made an incision almost four inches in length, beginning about three inches from spinous process and immediately below the last rib and going outward and downward towards the crest of the ilium. The incision was right over the tumor. Every vessel was tied immediately, so as to keep the field clear of forceps. After severing muscles and fascia we came to the abscess wall, which I punctured once more with the aspirator needle and upon reassurance laid it wide open. Fully one and a half pints of very offensive, green pus flowed from the wound, exposing a large cavity to view. After irrigation one could recognize broken down kidney tissue and structure in the cavity. Little remained besides sac-wall (capsule) and inflammatory debris.

The patient continuing to behave pretty well, it was decided to remove the remaining kidney tissue and capsule. The deeper incisions were extended so as to conform with the length of the superficial one. In doing this I was guided entirely by the sense of touch. It was certainly interesting to examine this wound. I could very easily feel the lower edge of the tenth rib, the colon and the diaphragm. After much work and anxiety I managed to remove what there was left of the kidney, but it was piecemeal work on account of the fact that the kidney had extended well up under the ribs. Hæmorrhage was moderate. The stump was tied with braided silk and the ends left long for future extraction. As the stump was short I caught the distal side of the ligature with a large forci-pressure forceps and holding thus both pedicle and its ligature, it was left. Two smaller vessels were secured with hæmostatic forceps, but could not be tied conveniently, so they were left *in situ*. During the whole operation moderate pressure was made on the abdomen so as to force the bottom of the cavity nearer to the back. This was also done during the packing of the cavity with iodoform gauze. The wound was left wide open. This was done so as to be prepared, in case of hæmorrhage, to at once get at the vessels.

The patient rallied fairly well. Hot bottles had been employed throughout the operation and were continued for some time after. Brandy injections were frequently made. The patient was removed to his bed with the greatest care, lest we should disturb the forceps left in the wound, and for the same reason we kept him bolstered left side up.

When I called in the evening I found the dressing prettly well soaked with blood, but I was informed that what blood could be seen had shown itself within two hours after the operation, and had not increased any since. It was fully eight hours after the operation when I called,

and I therefore decided to leave the dressing undisturbed, all the more so because his condition was fair. At midnight he was the same; no more hæmorrhage. He merely complained of some smarting in the wound, the pain he had complained of before the operation had left him entirely.

Next day: Temperature 101° F.; pulse 100, of fair strength. Outside dressing changed; wound was left undisturbed. Had passed no urine; but I drew off about 2½ozs. with a catheter.

After this he passed urine himself. It increased in quantity. I did not measure it again. For the next three days the dressing was not disturbed, as the patient was doing well and the temperature was declining. As he still had some vesical uneasiness I began giving on the third day, 5 grains of benzoic acid three times a day, which seemed to do him good. On the tenth day I removed gauze packing and the forceps; irrigated the cavity and renewed gauze packing. Temperature was now 99° F; pulse 80. After this nothing eventful took place except that the ligature came away on the 20th day. All this time the packing was growing less, as the cavity contracted.

Patient was discharged cured after five weeks. Urine at time of discharge contained but few pus cells (probably from bladder), otherwise it was normal.

Three months after I had occasion to treat him for a wound of the leg and obtained some urine for examination. It was perfectly normal. He did not know how much he weighed now but he stated that he thought that he had regained all the flesh he had lost. At the time of his discharge I advised him to forever abstain from alcoholic beverages of all kinds and to drink as much milk as possible. I saw him at intervals for about two years and he continued well. He is well and living now.

Case II. A. T., æt. 20; U. S.; unmarried; upholsterer; family history—mother had died of consumption.

He had been ill during the winter of '90–'91; thought he had influenza. From the description of the ailment, I think he had influenza, but whether this had any thing to do with the trouble under consideration I cannot say. I was first consulted on March 3d, '91, and at that time he was suffering from an attack of subacute bronchitis, This soon disappeared upon treatment. He told me at this time that he had been treated for spinal trouble after the attack of influenza, and again for lumbago. After the bronchitis subsided he was by no means well. He continued to fail. He complained of pain in his back. It was an indefinite, dull pain. I examined his urine and found pus and albumen. He was pale, emaciated and nervous, and had been, as he was now, suffering from night sweats. I put him on a well-regulated milk diet in addition to other easily digested foods. Still he failed in strength and weight. That he had some kidney lesion was certain, but in what form I was unable to say. In June of the same year he came to my office and said he had pain in his penis and left testicle, besides a well-defined pain, dull in character on the left side of his back. He also said that he had to pass his water oftener than usual, and had on one occasion passed some clots of blood. On examination I found distinct pain on pressure on the left side over the kidney. I could detect no swelling through the abdominal walls or in the loin. I forgot to mention that he also complained of a moderate diarrhœa. Examination of urine revealed clots and shreds, albumen and pus. Did not examine for bacilli of tuberculosis. But from his antecedents and his general condition, I made up my mind that he had tuberculosis of the kidney. I told him that we would have to operate on him with the result that he remained away from my office.

On October 2, 1891, he returned to my office telling me that he had been waiting for me (I had been away on a six weeks vacation), and that since he had been to my office last he had noticed an enlargement in his left loin, and had considerable pain there. On examination I found a fullness where he had indicated it. There was pain on pressure, no fluctuation that I could obtain. The exploring needle brought forth pus after three attempts to obtain it. Operation was advised and was performed the next day.

Operation:—Just before the operation he called my attention to his left elbow, where he had a swelling which I made out as tuberculosis of the joint. Ether was administered. Incision was made pretty nearly as in Case I. only about one inch longer, and the kidney was soon reached.

The capsule was opened and several ounces of liquid pus flowed therefrom. The capsule was now torn wide open and it was found that the whole organ was one large caseous mass; it was much larger than the normal kidney should be. The caseous mass was easily removed in spite of its large dimensions and the pedicle tied. There was no hæmorrhage of consequence. The skin and muscles were united with catgut and silk sutures in the upper part, the lower half being left open for packing and drainage. He rallied quickly and made a rapid and uneventful recovery, except that a small sinus persisted for over two months in spite of iodoform bougies, etc. It finally closed. He passed water as usual the day after the operation and never had trouble with it thereafter. His diarrhœa ceased; probably due to the fact that he was confined to bed and to morphine given for the pain. A few days after the operation I treated his elbow with iodoform injections and continued to do so for some weeks after, and he did fairly well, but he never regained complete use of the joint. I advised resection of the joint and was denied the privilege of operating. I did not persist, for I expected more trouble. I did not see him after his fistula had healed, although I recommended constitutional treatment. He walked about and did fairly well, however.

In the spring of 1892 he called and was found to be pretty well advanced in pulmonary phthisis. He said he merely wanted to know what ailed him and wanted no treatment as he knew he would soon die. He died a few weeks later. Autopsy denied. The joint had become somewhat larger, but he had had no renal symptoms from the time of operation to the time of his demise.

I have looked extensively into the literature on the subject of nephrectomy and as there is now such a mass of it, I will only draw conclusions and give them here.

I have found, that in a general way, operators prefer the lumbar operation for suppurative diseases of the kidney on account of the advantage for drainage, and the avoidance of opening the peritoneum and thus infecting it. Many prefer to do nephrotomy preparatory to nephrectomy. Lange, of New York, says he now prefers to do the whole operation at one sitting, because he has found that patients do not gain anything by waiting, and besides the operator has cicatricial tissue to contend with in a secondary operation. Gerster says he has not made up his mind yet which is the better plan. Briddon, of New York, prefers the primary operation.

Large tumors of the kidney should be taken out through the abdomen. Drainage can be established through the back before or after the major operation, when the kidney is removed through the anterior abdominal walls.

The incision may be made posteriorly from the last rib to the crest of the ilium near the edge of the erector spinæ. Some prefer to resect or remove one to two ribs, twelfth and eleventh, when deemed necessary. Others caution against this procedure as the pleura sometimes extends down to the last rib, and has been wounded in operations of this kind. Some operators add a transverse incision to the vertical one, when more room is needed. Wyeth makes use of an oblique incision.

When it has been decided to operate through the peritoneum (anteriorly) the majority prefer the incision made through the linea semi-lunaris (Lateral Laparo-nephrectomy); others prefer the median incision (Laparo-nephrectomy), which is made just as in ovariotomy.

In a general way it may be stated that the lumbar operation presents more favorable statistics than the ventral. In cases of suppurative lesions of the kidney especially, in which it may be decided to operate anteriorly "cysto-entrorrhaphy" should always precede opening of the sac.

Note.—In the first case the ligature disappeared, nothing of the stump came away. Patient well. In the second case, patient also complained of diarrhœa.

FISSURES OF THE TONGUE.

The following (*Le Bulletin mèdical*, is praised:

℞
Carbolic acid..... 2.5 grams.
Tr. iodine..... } aa
Glycerine..... } 12.5 grams.

MOUTH WASH.

In an article on the mouth as a focus of infection for various diseases, MILLER highly recommends the following as an aseptic mouth wash:

BUFFALO GENERAL HOSPITAL SURGICAL CLINIC.*

PROF. ROSWELL PARK.

EPITHELIOMA OF JAW, INJURY TO SKULL, CYSTIC TUMOR OF BREAST WITH POSSIBLE MALIGNANT ELEMENT.

I have talked to you very often about malignant growths, and have referred to the question of justifiability of operation and the clear understanding which ought to exist between patient and surgeon as to the risk of operation. This patient who presents an aggravated form of malignant trouble I have brought before you to illustrate how determined some men are to take the chances of operation rather than to discuss the prognostic and pathological features of their cases, which are quite plain. Seventeen years ago, this man had a little growth—presumably an epithelioma—removed from the lip. He was free from any manifestation of malignant disease till a little over a year ago when a growth about the size of a pea was noticed on the neck and was shortly afterward excised. This I interpret to have been an infected lymph-node which had become adherent to the skin and was beginning to break down. A couple of months ago the trouble returned and was again removed. Since then it has recurred and it has been treated once or twice with cancer pastes. On still further recurrence of the trouble he went to the same man who applied the paste and was told that it was too late for a repetition of that treatment since anything which would eat out the cancer would eat out the artery also and that an operation would not be advisable on account of the danger of hæmorrhage from the carotid artery or the jugular vein. His trouble has been getting worse all the time and last night he went to his regular physician and told him that he was going somewhere for operation and the doctor kindly brought him to me.

Here is a man of fifty, on the lower part of whose face you can see a large tumor, ulcerating on the surface. There is no question as to the diagnosis—it is an epithelioma—but only as to its extent. It extends beneath the floor of the mouth and, though it may not be attached to the larynx, it is very close to it and is probably attached to the hyoid bone. It is firmly adherent to both the upper and the lower jaw and there is ulceration about the alveolar process. It lies closely upon the carotid sheath. I have spent nearly half an hour in the vain attempt to convince this man of the futility of operation. I have told him that a thorough removal of the growth is practically impossible and that if it were possible, there would be so much loss of substance from the operation that I could not bring the edges of the wound together. I have explained to him that an operation which was not thorough would excite a renewed activity on the part of the cancer cells and would, therefore, be worse than useless. I have warned him that he might die on the table and that, in any case, the operation would result in his death and I have told him that I did not want to act as his executioner. Even after all this has been said, he insists that he wishes the tumor operated on. Sometimes we find a case in which there is an excellent prospect for an early operation and after exhausting all our eloquence we can not induce the patient to submit to an operation. Here we see an instance of an equal determination under exactly opposite circumstances. If this patient had come to me two months ago, I might have advised operation as a matter of temporary relief. Now I can only advise him against operation. I have told him that I would not operate for a few days under any circumstances and have gotten him to promise to go home and make his will and talk the matter over with his family. If after all this, he still insists on operation, I have told him that I will consider the question again but I doubt whether it would be justifiable to operate under any circumstances. It certainly would not be unless I had given him to understand clearly about the gravity of his case. I have been accused of being too blunt in talking to patients about the dangers of operation but you can judge if it would be right for me to fail to let patients realize plainly what they may expect both from such a course and from the unmolested course of their trouble.

Yesterday there was brought into the hospital a young Polish lad who had been

*Reported by A. L. Benedict, A. M., M. D.

injured three or four days ago by a locomotive. There is a rather uncertain lesion of the brain and I have not yet been able to make a positive diagnosis. Yesterday he was unconscious and when he was disturbed or when I pressed about the wound on his head, he would cry as he does now but with this difference that yesterday he made no articulate sound, whereas to-day he realizes to some extent what I am doing and replies with some intelligence. The question yesterday, as well as to-day was, whether the case demanded operation. It certainly was not a case of marked compression of the brain. The bodily functions were performed well, his pupils were of the same size though somewhat contracted on account of the morphine which had been given to control his restlessness. He moved all his extremities and their movement is even freer this morning. I have had his head shaved since I last saw him and you can plainly make out the scalp-wounds, one on the fore-head, the other over the right parietal bone. There is some ecchymosis about his right eye but there is not sub-conjunctival hæmorrhage, as there probably would be if there had been a fracture of the skull, resulting from the working forward of blood along the optic sheath. There is discoloration of the back of the head extending well down into the cervical region. The temperature has not been high. This morning it is 100.5°. After spraying out the scalp-wound with hydrogen-peroxide and carefully disinfecting my finger, I insert it into the wound and find no irregularity of bone. The finger is the best possible probe for making such an investigation. As there is no indication of serious trouble within the skull, I will put back the iodoform compress, over the wound, give symptomatic treatment and be ready to interfere if necessary. My conclusion is that the boy is suffering from concussion of the brain and possibly some minute hæmorrhages which would carry the case over into the category of contusion. It is quite likely that there has been a fracture but I do not pretend to say where. If, in two or three days from now, there should supervene compression symptoms, you know that the interpretation would be meningitis with pressure from pus. I should explore the wound, trephine and wash out the suppurating localities. This complication, however, I do not anticipate.

This patient, a woman of sixty, has a condition of considerable interest in a diagnostic way. In the breast she has a tumor and the question arises first, as to whether it is benign or malignant, and second, as to what is best to do for it. About two years ago, she noticed a little nodule in the breast and this has slowly enlarged and there is the history also that, several months ago, she was struck in the breast by her drunken husband. Here is a breast very much deformed by whatever the condition may be, the excess of deformity being of rather recent development. I want you to note that the nipple is retracted, that the tumor is lobulated, and that at two or three points there appear glistening surfaces almost like soap bubbles. There are little pouches that fluctuate just underneath the skin, and if firm pressure were made over them, they probably would break. After the first injury by her husband, the little lump enlarged to the size of a hen's egg, and since the second injury, about two months ago, there has been a very rapid increase. The tumor appears to protrude at two or three points just beneath the skin. So far, I have not been able to find any enlarged lymph nodes in the axilla. Perhaps we should first consider whether this is an abscess or some cystic disease. Now, it would be possible to have an acute abscess develop at any time in the breast with or without a co-existing tumor, either benign or malignant. But we may dismiss the suspicion of acute abscess as the signs of inflammation are not marked enough and the only abscess which would have so long a duration as this growth has had, would be a tubercular one, while none of the indications of tuberculosis are present here. My opinion, given tentatively and subject to modification on examination of the excised tumor, is that there was a cystic disease of the breast into which hæmorrhage has taken place at the time of the blows, and I expect to find altered blood in the mass. The patient's age makes us suspicious of cancer and it is quite possible that there is a somewhat recently developed coexistent cancerous condition. I can scarcely imagine a cancer of the breast of three years' duration, occupying as much of the breast as this does, with which we should not find enlarged axillary lymph-nodes and also in which we should not find the breast more fixed than this. This

breast is easily movable over the pectoral fascia and although there may be some adhesions, it is not glued to the fascia as is the case in well marked malignant disease. We must bear in mind, however, the fact that a tumor in the breast of a woman of almost any age, although benign in its beginning, may undergo malignant degeneration. It is possible to have a tumor which, at one spot, is cystic and innocent, while in other places, scirrhous or round-cell infiltration is occurring. Whatever the exact microscopic condition, therefore, you will readily understand the necessity for operation. This is not a case to be left alone, it is not one to be treated simply by evacuating the contents of the little cysts and allowing the wounds to heal, it must be attacked radically, and the breast must be excised. If the condition is not essentially malignant, the prognosis is excellent; if it be malignant there is every probability of prolonging life. The retraction of the nipple which you see here is not necessarily an indication of malignancy. Here the nipple could scarcely be otherwise than retracted on account of the enlargement of the breast around it.

If the case is malignant, I shall not want to save any more tissue than is necessary to close the wound. If, on the other hand, it is benign, it is better to save as much as necessary of the overlying skin.

In operating, therefore, I shall take time to dissect the skin from the growth beneath and, then, if the appearance of the tumor is suggestive of malignancy, more skin can be sacrificed. As soon as the knife penetrates the skin, an abundance of altered blood comes out, showing that there has been a hæmorrhage from the blows received. On examining the mass removed, I find, at one point, very hard tissue, here at the base there is a little pus and anteriorly a multilocular cyst. The hard portion does not offer as much resistance to the knife as would most scirrhous cancers, but seems more like inflammatory infiltration. This breast, though presenting no positive evidence of malignancy, presents a far worse appearance than do the majority of cases of cancer. It is a lesson to us not to judge too hastily from the external appearance. I am not quite satisfied that there is no malignant trouble and I, therefore, extend the incision toward the axilla in order to search for lymph-nodes. Now I find, deeply situated, a number of nodes so enlarged as to afford a suspicion of cancerous infection and this makes it necessary to clean out the axilla. To be sure the presence of pus in the mammary structure might account for this lymphatic involvement; but it is much better for the woman to have this operation thoroughly done *now*, than to have to subject her to a second operation later.

Communications.

TREATMENT OF HEMORRHOIDS.*

By JOHN B. DEAVER, M. D.

In opening the discussion upon the treatment of hemorrhoids I will confine the few remarks I have to make to what I consider the most essential points. And first a word as so the formation of this form of tumor and its varieties.

To understand the origin of piles we must be familiar with the arrangement of the veins of the rectum. The hemorrhoidal veins number three—the superior, middle, and inferior. The superior empty into the portal system, while the middle and inferior empty into the general venous system. In the upper part of the rectum they are arranged longitudinally, While below they are arranged circularly in the shape of a plexus, the hemorrhoidal veins are destitute of valves. Owing to the office of the rectum and to the erect position, these veins are very liable to become dilated and varicose.

To speak of a dilated and varicose condition of the veins in themselves constituting a hemorrhoid is a mistake. The first step in the formation of a hemorrhoid is a dilated and varicose condition of the veins, I admit, but, in addition to this condition of the veins there must be associated with it inflammatory exudate.

Hemorrhoids are divided into three varieties—external, internal, and intero-external. Hemorrhoids which protrude at stool, and are capable of being replaced and retained within the sphincter are of the internal variety, while hemorrhoidal tumors situated outside of the sphincter which cannot be forced inside are of the external variety. The intero-external

*Read before Phila. Co. Med. Society, November, 23, 1892.

variety is a combination of the external and the internal. This variety occupies the verge of the anus, and is covered by both mucous membrane and skin.

The internal hemorrhoid is a varicose and dilated condition of the superior hemorrhoidal veins, therefore an affection of the portal system. The external hemorrhoid is a like condition of the middle and inferior hemorrhoidal veins, therefore an affection of the general venous system.

In the intero-external variety both sets of veins are involved.

External hemorrhoids are met in any one of three different forms. The first is simply a venous tumor, the result of a phlebitis and consequent thrombosis of a varicose vein; the second, a tumor composed of dilated and varicose veins with proliferation of the surrounding connective tissue; the third, a tumor made up almost entirely of proliferated connective tissue.

Internal hemorrhoids are met with as one of two forms: the capillary and the venous. The capillary hemorrhoid is composed of the terminal branches of the arteries and veins and intervening capillaries. It is this form of hemorrhoid which bleeds upon the slightest irritation; its surface, too, is granular, and presents somewhat the appearance of a strawberry. The venous hemorrhoid is made up of anastomosing veins and connective tissue; this I regard as but an advanced stage of the capillary hemorrhoid.

The treatment of hemorrhoids is palliative and radical.

Concerning the PALLIATIVE treatment I will have but little to say other than that I regard having the bowels move daily, and observing the strictest cleanliness, the two most important indications to be fulfilled. Doubtless, in some instances one or other of the various astringent ointments, so commonly used, may be of some advantage, yet, I have little faith in their accomplishing a cure.

Before recommending radical treatment, the case is first to be thoroughly examined to determine whether such a procedure is justifiable.

Hemorrhoids may be symptomatic of visceral disease, of structural changes in the wall of the rectum above the pile-bearing area, such as carcinoma, stricture, etc. Under these circumstances the proper treatment would be the correction, if possible, of the condition giving rise to the hemorrhoids. Again, they are often secondary to disease of the uterus, the bladder—as when a calculus is present—an enlarged prostate or a stricture of the urethra, etc.

In advising radical treatment a careful examination should be made first to determine whether any of the previously mentioned conditions are present or not. The urine is to be carefully examined, when, if albumen is present and dependent upon heart or kidney affection of a serious character, operation is to be strongly advised against.

THE RADICAL TREATMENT OF EXTERNAL HEMORRHOIDS.—In the first form, that of the venous tumor, the result of a phlebitis, thrombosis, etc., it will suffice to incise the tumor freely, and turn out the clot, after which the wound is to be packed gently, and thus favor healing from the bottom. In the second variety, that of dilated and varicose veins with proliferation of the neighboring connective tissue, it will often suffice to stretch the sphincter muscles, when, if this fails, I strongly recommend removal of the tumor with the clamp and cautery; in the third variety of external pile I also use the clamp and cautery. In either of the two latter varieties, when the tumors assume considerable size, it may not be possible to engage them individually in the clamp; under these circumstances they should be bisected, as it were, and each half clamped, the redundant portion cut away, and the pedicle cauterized. It is in this variety of pile, when involving the entire circumference of the anus, that the Whitehead operation is applicable, but so far as my observation goes it does not offer any advantages over the clamp and cautery. When the external pile presents itself in the shape of a tab of skin it will suffice to remove it with a pair of sicissors; in the event of bleeding following, it can usually be checked by the application of a wad of styptic cotton, over which is placed a compress and bandage, or the bleeding-point may be touched with the point of the cautery. In the second and third forms of external pile, if inflamed, tense, and painful, I think it much more satisfactory to etherize the patient and remove them at once, and not attempt to reduce the in-

flammation by the application of lead-water, laudanum, poultices, etc. I have found this a much quicker way to dispose of them, and at the same time less painful to the patient.

Operations for Internal Hemorrhoids.—In few departments of surgery have there been more operations devised for the cure of any one condition than that of internal hemorrhoids.

The following is a list of the most important which have been advocated:

Excision; removal with wire écraseur; injection with carbolic acid or an astringent; the application of acids; removal by the galvanic cautery wire; dilatation of the sphincter muscles; clamp and cautery; crushing-ligature and Whitehead's operation.

Of these, I have had experience with the clamp and cautery, ligature, injection of carbolic acid, Whitehead's, and dilatation of the sphincter muscles. I now, however, rarely do any other than the clamp and cautery.

The advantages which the clamp and cautery possess over all other procedures is its universal application. The instruments required to perform this operation are a Smith's clamp and a pair of pile forceps, a pair of scissors, and a Paquelin's cautery. A tenaculum or vulsellum may be used in place of pile forceps.

The first step in the operation is the dilatation of the sphincter, which is followed by protrusion of the piles. The piles are now grasped with the forceps and the clamp adjusted. With the scissors the pile is trimmed down, leaving a pedicle one-quarter of an inch in length above the clamp. With the cautery iron at a dull-red heat the pedicle is reduced one-half-presenting a charred and dry surface. The clamp is now removed and the edges of the stump allowed to fold in. By leaving a pedicle as described, bleeding cannot follow the removal of the clamp. In cases, where the pile-surface is muco-cutaneous before the clamp is adjusted the skin should be divided with a pair of scissors, thus eliminating pain and subsequent contraction. The operation is completed by the introduction of an opium suppository, dusting the surface with iodoform, and the application of an antiseptic dressing. The after-treatment consists of rest in bed, light diet, and of the administration of one-quarter of a grain opium pill night and morning for from three to four days, when the bowels are moved by a laxative and an enema given when the desire to defecate is felt. After this the patient is allowed the freedom of the room.

The advantages of this operation are freedom from hæmorrhage, the rapidity with which it is performed, the absence of pain in the majority of cases, the absence of retention of urine, and the patient's being able to resume his or her occupation ordinarily in from one week to ten days. Pain, irritability of the bladder, and prolonged convalescence occur in neurotic subjects. Further, I believe tetanus is less likely to follow this than any of the other operative procedures.

The objections to the ligature are the pain which follows the tying of the pile, retention of urine, the amount of blood lost in debilitated subjects, and the prolonged convalescence consequent upon the process of separation of the ligatures.

The objections urged against the injection of hemorrhoids are the liability of sloughing and fistula, the formation of abscess, the possibility of a diffused inflammation with pyæmia, an extension of the inflammation to the peritoneum, and embolism. While injecting a pile the base should be constricted until coagulation takes place, to prevent an embolus from being carried into the circulation.

The objections to the Whitehead's operation are the time required for its performance, the amount of blood lost, and the danger of the stitches cutting out, leaving a circular granulating surface which may result in atresia of the rectum. Again, it is only applicable in a comparatively small number of cases.

Dilatation of the sphincter muscles, like the Whitehead operation, is only applicable in a few cases, especially those of recent origin, and in the case of prolapsed hemorrhoids which are prevented from repositing themselves on account of being grasped by the sphincters. In the former instance it may suffice to bring about a cure if proliferation has not taken place to any extent, which is always questionable. In the latter case it can only offer a palliative means. When internal hemorrhoids become strangulated and gangrenous, they should at once be removed, preferably with the clamp and cautery.

THE TREATMENT OF ISCHIO-RECTAL ABSCESS AND FISTULA-IN-ANO.*

By HENRY R. WHARTON, M. D.

I have been requested to say a few words this evening on the treatment of ischio-rectal abscess and fistula-in-ano to open the discussion upon these subjects by the members of this Society.

Treatment of Ischio-rectal Abscess.—In this form of abscess the purulent matter occupies the loose cellular tissue of the ischio-rectal fossa in close relation to the rectum, and from the anatomical peculiarities of the tissue in which it is situated it is apt to burrow widely and, if left to itself, to open into the rectum or through the skin into the region of the anus, and result in the production of one or other forms of fistula-in-ano, either the complete form or the external incomplete form of this affection.

To obviate this unfortunate result the prompt treatment of ischio-rectal abscess is urgently demanded, and I am decidedly of the opinion that attempts at abortive treatment of this form of abscess are worse than useless, that by such treatment valuable time is lost, and the surgeon has finally to resort to surgical treatment after extensive burrowing of pus has occurred with possibly perforation of the wall of the rectum.

It is, and has been for a long time, a surgical axiom that an ischio-rectal abscess should be opened promptly, and if so treated the probability of a fistula-in-ano resulting is much diminished. I formerly was satisfied to open these abscesses by a small incision, evacuate the pus, and in many cases a prompt recovery took place without the formation of a fistula, but in others a fistula resulted; whether the rectal communication was present at time of opening or resulted from the imperfect drainage secured by a small incision I am unable to say, but I am sure that the results I have obtained in these cases during the last few years since I have adopted Mr. Allingham's method of dealing with these abscesses have been much more satisfactory. By this method of treatment, even in cases where I have been able to demonstrate a rectal communication at the time of the operation, I have secured healing without the formation of a permanent fistula. Therefore, in any case of inflammation of the tissue of the ischio-rectal fossa, whether the evidence of abscess be clearly demonstrated or not, I follow the method which is recommended by Mr. Allingham, which consists in etherizing the patient and placing him in the lithotomy position, after having located the position of the indurated tissue or abscess; and a rectal examination by means of the finger will often assist in locating the position of the abscess. A free incision, several inches in length, is made through the tissue, outside of and parallel with the fibers of the external sphincter muscle, and the incision is gradually deepened until the pus cavity is reached. It is then slit up to the length of the skin incision and the cavity is explored with the finger, breaking down any loculi which tend to divide up the abscess cavity, and so make one cavity. The cavity of the abscess is next washed out with a 1: 2000 bichloride of mercury or 1: 60 carbolic acid solution and is then packed with strips of iodoform gauze, and a pad of the same gauze is placed over the wound, and over this a pad of bichloride of mercury cotton is laid, and the dressing is secured in position by a T-bandage. An opium suppository is introduced into the rectum and the bowels are kept quiet for three or four days.

The dressing is not removed for two or three days, and at this time the packing is usually loose and can be removed without difficulty; after its removal the cavity is injected with peroxide of hydrogen; it is then irrigated with a 1: 2000 bichloride of mercury solution; next the cavity is lightly packed with strips of iodoform gauze and the wound is covered with a pad of iodoform gauze and bichloride cotton. The same steps are observed at subsequent dressings, which are made at intervals of two or three days. The cavity usually heals rapidly by granulation and contraction, and in a few weeks it is completely healed.

Mr. Allingham recommends that the cavity be packed with lint saturated with carbolized oil, and I have employed this material, but now prefer to use the iodoform gauze, as I stated above.

I will report briefly a case in which this treatment was adopted. In January of

*Read Phila. Co. Med. Society, November 23, 1892.

this year I saw, with Dr. Musser, a lady, forty years of age, who had suffered for a few days with inflammation of the tissues of the ischio-rectal fossa. On examination of the case I found the left buttock for a distance of six or eight inches from the very verge of the anus, indurated, hot, and painful; no soft spot of pointing could be detected. An examination of the rectum showed bulging of the walls of the rectum in the left side, and upon withdrawing the finger a small amount of pus escaped from the anus. The patient also stated that some matter had been discharged from the rectum during the day. The patient was etherized and a curved incision four inches in length was made just outside of the line of the sphincter muscle. This was gradually deepened until the cavity of the abscess was opened and a free discharge of many ounces of pus followed. On introducing my finger I found that the cavity extended laterally for some distance and passed upward between the wall of the rectum and the sacrum. In fact, with my two fingers introduced to their full length in the wound I could not reach the upper portion of the abscess cavity. A careful examination failed to reveal the position of the opening into the rectum. The abscess cavity was thoroughly irrigated with a 1: 2000 bichloride of mercury solution, then packed with strips of iodoform gauze and a pad of gauze and bichloride cotton was placed over the external wound and held in place by a T-bandage. The patient did well after the operation. The cavity was dressed in the same manner very second or third day for the first two weeks, and at less frequent intervals after this time for six weeks, at which time healing was complete.

There is no question in my mind that there existed a communication between the abscess cavity and the rectum before the operation, as was shown by the discharge from the wound about a week after the operation of a piece of bone a little larger than a grain of corn. This bone, Dr. Harrison Allen examined for me and pronounced it to be a portion of a transverse process of a sheep's vertebra. It had been swallowed with the food, had ulcerated through the wall of the rectum, and had set up inflammatory action in the peri-rectal cellular tissue, terminating in this extensive abscess.

The points in the treatment of ischio-rectal abscess I would especially call attention to are: Early and free incision; thorough breaking down of any secondary cavities into one cavity; irrigation of the cavity with peroxide of hydrogen and a 1: 2000 bichloride of mercury solution or 1: 60 carbolic acid solution; packing with iodoform gauze and subsequent dressings made in the same manner, care being taken not to pack the cavity too firmly. Following this form of treatment the results of this variety of abscess in my hands have been most satisfactory.

Treatment of Fistula-in-ano.—Ball classifies fistula-in-ano as *complete* rectal fistula, in which there is a sinus leading from the rectum to some point in the skin in the region of the anus; and the *incomplete* fistula he describes as *internal rectal sinus*,—a sinus passing from the rectum into the peri-rectal cellular tissue; *external rectal sinus*,—one having an opening on the skin passing into the cellular tissue around the rectum, but not perforating the wall of the gut.

As regards the treatment of fistula-in-ano, the fact should not be lost sight of that it is possible to have a fistula-in-ano heal under simple treatment without operative interference. This is more apt to occur in recently formed fistulæ, but as the result of palliative treatment is always uncertain in these cases, and a long course of local applications is required, this method of treatment is not generally adopted. Allingham says that he has had twenty-one successful cases under this method of treatment, and a number of cases in which he was unable to effect a cure after prolonged treatment. When this form of treatment is adopted it consists in trying to obliterate the fistulous track by rest, free drainage, and the local use of stimulating applications such as carbolic acid, nitrate of silver, and sulphate of copper. Rest to the part is best secured by the wearing of a firm anal pad secured by a T-bandage.

At the present time the most widely adopted and successful treatment of complete fistula-in-ano is by incision. The patient is etherized and placed on his side or in the lithotomy position, a probe-pointed flexible director is then passed through the external opening of the fistula and conducted into the rectum; the finger is then passed through the anus until it

comes in contact with the end of the director, which is bent and brought out of the anus; the tissues on the director are then divided with a scalpel or by means of scissors, care being taken to see that the division of the fibres of the sphincter muscle is made at a right angle to the course of the muscular fibers; oblique divisions of the muscle do not heal well and are apt to be followed by a loss of power in the muscle. The main track of the fistula being slit up, it is next explored for the presence of branching sinuses, and if these are found they are slit on a director. In indurated sinuses it is often well to make an incision through the base of the sinus, which seems in many cases to facilitate the healing. If the cutaneous edge of the fistula or sinuses tend to overlap each other near the anus they should be trimmed off with scissors. The surface of the exposed fistula or sinuses is next freshened with a curette, and after being washed out with a 1: 2000 bichloride of mercury solution the cavities are packed with strips of iodoform gauze or lint saturated with carbolized oil. A compress of gauze is next applied over the wound, and over this is placed a pad of bichloride cotton, and the dressing is held in place by means of a T-bandage. The patient is given an opium suppository, and the bowels are kept quiet for three or four days.

The after-treatment of fistula-in-ano is most important, and many unfavorable results are due to carelessness in this particular. On removal of the primary dressing, at the end of two or three days, the sinus should be washed out with peroxide of hydrogen and a 1: 2000 bichloride of mercury solution, and a strip of iodoform gauze should be lightly passed to the bottom of the wound and allowed to rest between its edges. The mistake is often made in packing these wounds forcibly, which interferes with healing. A piece of gauze and a pad of cotton is next applied over the wound and is held in place by a T-bandage. The patient should be kept on his back two or three weeks, and the wound should be dressed in the manner described daily or on alternate days, and at the end of three or four weeks healing is usually completed.

In cases of fistula-in-ano of the horseshoe variety, one division only of the external sphincter muscle should be made, and the branching sinuses should be laid open by curved incisions passing parallel with and outside of the line of the muscle. Sinuses extending to the perineum or buttock should be freely laid open.

The treatment of incomplete fistula of the external variety, or of external rectal sinus, consists in passing a director into the sinus down to the rectum, and if on passing the finger into the rectum, it is found that the director is separated only from the finger by the mucous membrane, and its position is low down in the rectum, it is better to push the director into the bowel and bring it out at the anus and divide the tissues as in complete fistula, and treat the resulting wound as described after the operation for complete fistula. If, on the other hand, the rectum is merely exposed at the bottom of the sinus, it is well to lay the sinus freely open to this point, curette its surface and pack it lightly with iodoform gauze. Subsequent dressings should be carefully made and the sinus will usually heal, though the course of treatment usually extends over a longer period of time than in cases where the phincter muscle has been divided.

In internal incomplete fistula, or internal rectal sinus, when the rectal perforation is low down, a bent director should be passed into the anus, and its point should be passed through the rectal opening and made to project on the skin near the anus. This is cut down upon and exposed and the director is pressed through it, making the fistula a complete one, and the tissues on the director are divided. The subsequent steps of the operation and dressing are similar to those mentioned in the cases previously described.

When the rectal opening is high up and it is considered inadvisable to divide the sphincter muscle or the bowel to its full extent, a director should be passed through the internal opening and the surgeon should cut down on its point from an incision through the skin a little outside of the sphincter muscle. When it has been exposed the sinus or cavity should be curetted and irrigated and dressed with iodoform gauze, and by careful dressing the wound may be made to heal from the bottom, the rectal communications being shut off by granulation and subsequent contraction.

Among various methods of treating fistula-in-ano should be mentioned the

elastic ligature and the treatment by excision.

The elastic ligature is principally used in those cases in which the fistula opens into the rectum at a high point, where division by the knife would be accompanied by free hemorrhage. When employed, a cord of india-rubber one-sixteenth of an inch in diameter is threaded to an eyed-probe which is passed through the cutaneous opening into the rectum and brought out at the anus; before tying the ligature, the skin and mucous membrane to the edge of the anus should be divided so that the ligature can bury itself when tied, thereby saving the patient pain and at the same time facilitating the more rapid division of the tissues by the ligature. After the ligature has cut its way through the tissues it is often found necessary to dress the wound in the same manner as in cases where incision has been practised, to secure satisfactory healing.

The treatment of fistula-in-ano by excision has been recommended by some surgeons. The fistulous track being dissected out, the parts are brought together by deep sutures, and if primary union is obtained there is a great saving in the time of treatment. The form of fistula to which this method of treatment is best suited is the complete fistulæ which are not very deep and have a straight course; branching fistulæ, and ones very deeply situated, I do not think are favorable cases for this procedure. If in using this method of treatment it is found that primary union has not occurred, as shown by the escape of a little pus from the line of the incision, the sutures should be removed and the edges of the wound should be separated, and it should be lightly packed and treated—in fact, as a case in which primary incision had been practised.

As fistula-in-ano often occurs in patients suffering from phthisis, the question of the advisability of operating upon these cases often must be considered. The rule in these cases is to operate unless the patient's disease is in a very advanced state when no repair could be likely to take place. In the majority of phthisical cases the result of the operation is satisfactory.

The only serious complication following the operation for fistula-in-ano is incontinence of feces, and this is fortunately a rare complication. It may be guarded against by care in dividing the sphincter muscle only at one point, and by seeing that the division of the muscle is not an oblique one. When incontinence exists, it may be relieved in many cases by excision of the cicatrix in the sphincter muscle and by suturing the freshened ends of the muscle together by catgut sutures, or by applying a point of Paquelin's cautery to the cicatrix or to several points of the mucous membrane and skin of the anal margin.

RUPTURE OF BICEPS—INFLUENCE OF THE MENTAL STATE OVER THE FŒTUS.

By JNO. M. CURRIER, M. D.
NEWPORT, VT.

A case was presented to me a few days ago that was new to me. It was a rupture of the fleshy part of the right biceps muscle from the tendon of insertion. I have seen many cases of rupture of tendons from their insertions or origins but never before one of this character.

Mr. J., a farmer, aged about fifty-five years, three weeks previously, was lifting some logs with a lever, and on making an extra exertion felt something snap in hisright arm which disabled him. The arm continued lame until I was consulted. At the examination I placed a weight in the right hand, the elbow being bent at right angles, and directed him to raise the weight; while making the attempt, the belly of the biceps could be felt contracting and the severed end of the muscle roll up and recede from my finger. On placing my finger on the tendon and its insertion, when an attempt was made to raise the weight, no motion, nor tension were felt. All the soreness was felt at the lower part of the belly of the muscle. The treatment in such a case consisted in keeping the elbow flexed and supported at right angles; pressure upon the belly of the muscle be kept up constantly with a concave splint, to produce extension of the muscle, until union takes place. No attempt should be made to lift the hand nor move the arm.

A case has recently come under my observation which illustrates in a remarkable degree, the influence of the state of the mother's mind over the nutrition of the

child in utero. Anna R., aged nine years, was recently attacked with whooping cough; when examining the case I learned the following early history. Ever since her birth she has had what the parents termed a "heart trouble." I found a loud systolic murmur, very distinct over all the region of the heart, and very much louder over, and to the right of, the sternum. The pulse were feeble at the wrist, but regular. The child had always been anæmic, tiring easily, and always unable to endure much exertion. While the mother was carrying the child (about the third month) she sent the oldest child down to build a fire in the kitchen stove, in preparation for dinner. When she thought the oven was sufficiently hot the mother came down into the kitchen to commence dinner. She heard a low moaning noise like some one in distress, and on opening the oven door out came the pet cat, that had been imprisoned therein, nearly lifeless. It soon died. This scene made a great impression upon the mother's mind, which she did not fully recover from for several days. Pregnancy went on as usual after recovery from the shock. At birth and ever since the child was feeble. The children born before and since this one were healthy and robust. Since the birth of this child the parents have been busy picking up instances of children deformed from the mothers' fright during pregnancy. This seems to be a case where only the heart was arrested in its development by the state of the mind of the mother.

Society Reports.

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Meeting of December 1st, 1892.

The President, Dr. W. H. H. Githens, in the chair.

Dr. Edward P. Davis presented a case of Pelvic Hæmatocele Treated by Abdominal Section and Gauze Drainage.

The patient married at seventeen and gave birth to a living child after a normal labor. Two months afterward she had a discharge of blood from the genital tract which continued for two months. Four years ago she became pregnant a second time but aborted. She recovered from this abortion and menstruated regularly till February 13, 1892, when she was seized with sudden pain, syncope and vomiting. When seen by the writer, six weeks after this, she complained of pain across the abdomen, of a bearing down sensation with a feeling of weight in the pelvis. An examination showed the uterus slightly enlarged and retroverted. A tumor of semi-solid consistence filled the lower portion of the pelvis and into this the uterus was merged. The uterus seemed to be part of the tumor and it was thought that a fibro-cystic tumor of the uterus or an ectopic gestation might be present. When the abdomen was opened, bloody fluid welled up from the right half of the pelvis. This fluid contained small clots of jelly-like consistency; the fluid and clots being the color commonly seen in hæmatocele. The fluid was found to have filled a sac situated behind the right broad ligament and extending downward into Douglas' cul-de-sac. It was without odor and no evidences of peritonitis or intestinal adhesions were present. No rupture of the fallopian tube could be found nor was the ovary apparently abnormal. The fluid was removed by sponging and the sac tamponed with iodoform gauze, the end of the gauze being brought out at the lower end of the incision. The patient's convalescence was normal, the gauze being removed several inches at a time.

After the operation her menstruation returned, regularly and painlessly, until early in September, when she again missed it for six weeks, and complained of pain and weight in the pelvis which was followed by flooding and the discharge of clots and material similar to that which had been expelled at a previous abortion. At that time she did not come under the notice of the writer but desired early in October an operation for closure of a laceration of the pelvic floor to correct a cystocele and rectocele of moderate extent. At this time she considered herself in the early weeks of pregnancy. On examination it was found that a condition of affairs similar to that which had formerly existed was present on the left side of the patient's pelvis, namely the uterus retroverted and a tumor of semi-solid consistence projecting into the cavity of the pelvis. The pelvic floor was closed, the patient making an uninterrupted recovery.

Whether this pregnancy is ectopic or intra-uterine is a possible question. The patient while not a bleeder, presents a remarkable tendency to hæmorrhage. It is the purpose of the writer to keep her under observation until the existence of intra-uterine pregnancy can be demonstrated or denied. If such be present, the effort will be made to prolong the pregnancy till a living child can be secured. If the pregnancy is not intra-uterine, and the pelvic tumor increases in size, there will be ground for considering the patient pregnant ectopically and this condition will demand appropriate treatment.

Dr. Charles P. Noble reported a Case of Successful Elective Cæsarean Section.

It was done for the relative indication and was elective in that, it being determined in the latter weeks of pregnancy that the delivery of a living child by the natural passages was impossible, the Cæsarean operation was decided upon and done during the last week of gestation but before the onset of labor. The reporter stated that the advantages of the operation, done before the onset of labor, are obvious as here we have a perfectly well ordered section in place of a hurried operation with the drawbacks of hasty preparations, perhaps strange assistants, bad light and faulty asepsis in some part of the technique. The danger of hæmorrhage from the failure of the uterus to contract properly in operations done before labor is purely theoretical and, excepting those cases where the uterus was paralyzed by the unnecessary practice of constricting it with rubber tubing, there was only one case on record where contraction did not take place.

The classical rather than the Porro operation was done, because the operator did not believe it proper, without grave reasons, to deprive a woman of the child-bearing function. The Porro operation should be limited to cases of fibroid tumors or those unfortunate cases where the operator has been called in late, after the patient has been long in labor and the danger of uterine atony and infection of the birth canal are present.

The patient was twenty-five years old, primipara, with scolio-rachitic flat pelvis the measurements being: A. S. S. 27.5 cm.—Cr. Il. 28.5 cm.—Tr. 33.5 cm.—D. B. [ext. conj.] 17.5 cm.—C. D. 8.75 cm.—C. V. 6.75 cm. She was told to return when seven months pregnant in order that the question of induction of labor could be determined, as against permitting her to go to term to be delivered by Cæsarean section. She did not return until the thirty-sixth week of pregnancy, when the child was too large to permit of its delivery alive. Symphysiotomy was considered but rejected on the ground that the pelvic deformity was extreme for the operation. The patient was prepared for operation by the use of baths, by having the bowels kept open, and by daily exercise out of doors. The operation was done on the 28th of September when the patient was estimated to be in the 40th week of gestation. When etherization was complete five grains of ergotine and one-fortieth of a grain of sulphate of strychnia were given hypodermically and an additional five grains of ergotine were given towards the close of the operation. The usual antiseptic precautions were followed. A free six-inch incision was made and the uterus incised *in situ*; hæmorrhage was free but not alarming and was kept out of the peritoneal cavity by pressing the abdominal walls against the uterus. The uterine incision extended well up toward the fundus, purposely avoiding the lower segment. The baby, a girl, was delivered by the feet and was soon crying lustily. As the baby was delivered, the uterus was withdrawn from the peritoneal cavity and the cervix was compressed manually. Contraction was good and the hæmorrhage at no time annoying. The placenta and membranes were carefully delivered and two fingers passed down through the cervix to secure a patulous canal for the lochia. Seven deep sutures [avoiding the mucosa] were now passed and tied; and fourteen superficial stitches. The uterus was now rinsed off with boiled water, the wound dusted with aristol and the usual dressing applied. The after-history was uneventful.

Dr. Mordecai Price reported a Case of Appendicitis.

The patient had suffered a number of years with what was supposed to be liver trouble; there was tenderness over the right side of the body, but no examination was made as there was no suspicion of any trouble up to eighteen months of her

death. Then her physician noticed a large symmetrical tumor filling up the entire lower abdomen. Operation was refused for the reason that, in her greatly emaciated condition and the feeble character of her heart, no encouraging prognosis could be given. The tumor ruptured and discharged through the bowel, after which the patient greatly improved. She had a number of such attacks extending over the eighteen months, when the tumor again filled up and ruptured, but she was not able to rally from the septic condition brought about by the suppuration.

The post-mortem showed a large abscess at the end of the appendix. The abscess was adherent to all the viscera and extended from crest of ilium to crest of ilium.

DISCUSSION.

Dr. Joseph Price said that, in dealing with troubles in the appendix, promptitude is of paramount importance. He scarcely attended a medical meeting without being told of dozens of deaths from appendicitis.

In regard to Dr. Davis's case, he would suggest that the patient is in precisely the same condition that she was when he operated and the indications are precisely what they were at first. He would dread to allow that woman to go over night, if she were his patient.

Dr. G. Betton Massey said that Dr. Price's case was particularly interesting in connection with that of Dr. Davis. In the one case, grave and serious, the waiting policy has been adopted; in the other it seemed to him that the operation had been too hasty. Dr. Davis's case is reported as a hæmatocele but he thought it had better be called a hæmatoma. He had no doubt that the abdomen was protected from invasion, as Dr. Davis had to separate adhesions to reach the blood. He had had two or three cases which disappeared under expectant treatment and forced absorptive methods with the negative galvanic pole in the vagina.

Dr. M. Price said that if Dr. Massey had ever seen a case of extra-uterine pregnancy he should think it would have taught him a lesson in regard to waiting. Dr. Price had seen ninety-seven extra-uterine pregnancies operated upon and had never yet, in twenty-three years experience, seen a true hæmatocele. Therefore, he concluded that true hæmatocele must be rare. He thought such a condition did exist but concluded that Dr Davis's case was one of extra-uterine pregnancy and that the condition would turn out to be the same on the other side also.

Dr. Charles P. Noble reported a Case of True Pelvic Abscess.

Mrs. H., aged 28, was delivered of her second child by a midwife, the labor being followed by septicæmia. Five weeks later she came under the notice of the writer. On examination the right broad ligament was found indurated and a mass of exudate extended on the right side of the abdomen almost as high as the umbilicus. At the operation the viscera in the lower right quarter of the pelvis were found fused together. The patient took ether badly and it was thought that an attempt to free the adhesions would result in a death on the table from ether. An unsuccessful attempt was therefore made to reach the pus by an incision near the anterior superior spine of the ilium. The patient improved for a few days, when a second attempt was made under chloroform, which however produced as much cyanosis as the ether had done. An incision was made directly over the broad ligament, evacuating several ounces of pus. With rubber drainage a satisfactory convalescence followed.

Twenty months later an operation was done for the cure of a ventral hernia which had formed at the site of the third incision. The operator was surprised to find that the adhesions had all disappeared except a point of adhesion between the omentum and hernial sac and another between the omentum and broad ligament. Both appendages were healthy, which demonstrates that it was not a pyo-salpinx but an abscess of the broad ligament.

The disappearance of the very extensive adhesions in this case is worthy of record as showing that peritoneal adhesions are not necessarily permanent. Undoubtedly acute pelvic cellulitis and true pelvic abscess do rarely occur as puerperal conditions, but they are extremely infrequent as compared with pelvic peritonitis, pyosalpinx, and purulent peritonitis.

DISCUSSION.

Dr. M. Price thought that leakage could take place from a tube and an abscess result which is not in the tube but walled up by the peritoneal inflammation,

making it extra-peritoneal. He was confident that a number of these abscesses, said to be of the broad ligament, are abscesses following some injury in the abdominal wall near Poupart's ligament, or between the peritoneum and the muscular structures of the abdomen, posterior to the peritoneum.

Dr. George E. Shoemaker said that abscess of the kidney sometimes occurred in this region as in the case of his own. Adhesions may be of a most serious character and invalid the patient. A short time ago he had operated on a patient who had been previously operated on by a member of this society, presumably in the best manner, but she had been for a year following the section a complete invalid. Dr. Shoemaker found a firm adhesion to the right broad ligament the size of a quarter. This had to be cut off and the bowel stitched. He did not believe that such an adhesion would be absorbed. After this adhesion was released she was well for the first time since the previous operation.

Dr. Joseph Price said that we all know that pus in the pelvis follows traumatism and particularly puerperal traumatism or filth, or that it follows some of those stab-wounds in criminal abortion. In regard to the absorption of the adhesions—why does it not take place in the healthy adhesions following a great number of sections in which we have to repeat the operation for ventral hernia? Adhesions once formed are exceptionally absorbed or released; and in this case, with fixed omentum and fixed bowel, he doubted very much if there were not some error in the first section.

Dr. George M. Boyd said that it seemed to him that we had inflammatory pockets and localized extra-peritoneal inflammation more often than is generally supposed, as the result of extensive cervical lacerations and the various tears of the vagina. This case seemed to be one of vaginal origin.

Dr. C. P. Noble agreed with Dr. Price that true broad-ligament abscess is rare, but it sometimes occurs. Dr. Joseph Price says that we do have suppuration in connective tissue in puerperal cases, particularly after criminal abortion. Of course this point has always been made. We have taken the position that in the great majority of cases the pus is in the tubes or within the peritoneum, but Dr. Noble thought that in the first enthusiasm of finding out that most cases of pelvic inflammation were not cases of pelvic cellulitis or true pelvic abscess, some took the exaggerated position of denying that we ever have cellulitis or pelvic abscess, and went a little too far; and for the sake of exact truth we must admit the existence of this condition. Why some adhesions were absorbed and others not, he did not know. It was impossible that he should have made a mistake in this case as he had his fingers on the adhesions.

Dr. G. Betton Massey reported a Case Illustrating the Treatment of Painful Prolapsed Ovaries in Young Girls.

The patient is a young lady of a sensitive, literary family, with an introspective bent. She menstruated early and, like many young girls, had painful periods. She was ill-developed physically and the periods were also irregular. The surgeon who was consulted is said to have diagnosed endometritis and uterine prolapse to a moderate degree, and a pessary was inserted. After the pessary had been worn for a little time it was removed, but not before it had caused great aggravation of the pre-existent condition. The case went from bad to worse, there were numerous consultations with physicians and surgeons, and removal of the ovaries and tubes was advised by several.

When seen by the writer, three years later, she was twenty-one years old. The uterus was in a condition of catarrhal inflammation, enlarged and tender; the ovaries, particularly the left, were prolapsed and very tender, although not enlarged. The position and painful condition of the ovary was, the writer thought, the condition which led so many surgeons to advise the unsexing of this young lady.

She was placed on rest, electrical treatment for her neurasthenia, and subjected to vaginal treatment by the galvanic current with a covered positive electrode. This resulted in a great amelioration of the tenderness of the left ovary. Up to this time the uterus had not been explored but, owing to the copious catarrhal discharge, a flexible aseptic sound was passed and the uterus found to be over three inches in depth, showing a greater source of trouble than the ovarian displacement. She was then put on the direct treatment for the endometrial inflammation with intra-uterine galvanic and faradic currents.

This was followed by marked improvement and recent advices state that she is entirely well, natural in her periods, and gaining flesh. The ovary still remains rather lower than the other but freely floating, and the writer thought that the slight deviation of position of that ovary would not cause any more trouble than a like freedom of movement of any of the other internal organs.

DISCUSSION.

Dr. George E. Shoemaker doubted if the patient's statements in the case of this kind should be accepted, and doubted very much if a girl giving such a history would go to several eminent physicians in this city and be told by nearly all that the ovary should be removed and yet be capable of cure by such slight treatment. He would remind Dr. Massay that increased length of the uterus need not go unsuspected until the sound be introduced. Bimanual examination will detect it more readily.

Dr. Charles P. Noble said he had never had a sick woman consult him who had been advised to have the ovaries removed and found nothing the matter. He thought that those who cast such imputations upon surgery should put themselves in a position to demonstrate that such things are true, and not take the statements at third or fourth hand.

Dr. Joseph Price said he often had patients, coming from a recognized operator, state that the doctor had recommended the removal of the ovaries; it was only necessary to ask a few questions to be able to tell the patient that probably the doctor was right; and in ninety-nine cases out of one hundred the examination showed that the physician was right. Dr. Massey makes a good point in regard to pessaries. Gynecologists know that it is important to correct displacements before using the pessary. The pessary is not to correct the displacement but to prevent its recurrence.

Dr. Massey stated that the surgeons were New York men. His authority was her physician, the patient herself and her sister. In justice to her previous attendants he would say that the case had been treated by conservative, non-electrical, methods before coming into his hands,

Elliston J. Morris, M. D.
Secretary.

PHILADELPHIA COUNTY MEDICAL SOCIETY.

Meeting of November 23, 1892.

Dr. Wharton read a paper on "Treatment of Ischio-Rectal Abscess and Fistulo-in-Ano." (See page 965)

DISCUSSION.

Dr. Thomas S. K. Morton: I am glad that Dr. Wharton has insisted upon early operation in ischio-rectal abscess. This affection involves loose cellular tissue richly supplied with lymphatics, and may give rise to profound septicæmia, if not pyæmia, if not relieved early. I have recently heard of a case of small ischio-rectal abscess which gave rise to pyæmia and death. The incision should be made as soon as the brawny induration is evident, feeling certain that if there is any inflammation in this region, where the tissues are so poorly supplied with bloodvessels and other means of destroying septic material, suppuration will follow.

In washing out these abscesses with a strong antiseptic solution it is important to see that all that goes in, comes out, and that none enters the bowel, for a few drachms of a strong mercurial solution entering the bowel would give rise to poisoning.

The packing should be applied loosely. Here, as well as elsewhere, much damage can be done by too tight packing. There is something about iodoform gauze that makes it superior to every other material for packing. What this is I do not know, but under its use the dressing is drier, there is less pus, and the whole case goes on in a more orderly and rapid manner. I like also to rub iodoform into the walls of these abscesses and into the sides of a fistula. Peroxide of hydrogen is one of the best antiseptics in these cases.

In regard to the bowels, I have a predilection for keeping them loose in all operations about the rectum, and very early give such drugs as will produce partially liquid stools. This gets rid of the great pain and the terrible anxiety of the patient looking forward to the movement of bowels that have been constipated for several days after an operation.

Repacking is important, but in many cases simple inspection, particularly in fistula, is all that is necessary to see that

healing is progressing properly, and, if necessary, the wound can be painted with some stimulating solution, as a fifteen-grain solution of silver nitrate, balsam of Peru, etc. By careful watching, the painful process of repacking can often be avoided, although in some cases it will be required to secure uniform healing from the bottom.

Coming to fistulo-in-ano, we should bear in mind that there are two great varieties: one is the tubercular, and the other simple or traumatic, where a small foreign body perforates the wall of the rectum and sets up inflammation in the cellular tissue. Probably the ones that form slowly are simple, but may become infected with the tubercle bacillus. Granting that the large majority are tubercular, the treatment must be thorough and radical in order to get rid of the tubercle bacillus.

I agree with Dr. Wharton in regard to the use of the ligature, that only cases involving high section of the bowel justify that method. By this method we are apt to overlook the branches which are so common.

It is not always best to carry the director through the fistula and lay it open at once. It is sometimes better to dissect from the outer opening, treating the branches as they are met with, rather than to make the incision and have the field of operation obscured by blood.

The excision of the fistula has not proven a success. I have conversed with one or two men who had much to do with the introduction of this method, and they acknowledge that after using it for several years it has proved far less useful than had been hoped. There were but few cases in which excision could be done, and of these few, the majority suppurated, and the edges of the wound had to be separated.

In fistulas that are tubercular, and perhaps, in all, after thorough dissection and opening up all branches, I have wiped the the wound out with pure caustic potash. That stops the hemorrhage, it kills the lining membrane throughout, and perhaps some healthy tissue, but I think that we get a more radical operation, particularly in tubercular cases. We must, however be careful not to go too deep. After using the caustic potash it is well to carry over the wound a sponge saturated with vinegar, in order to stop the action of the alkali. The induration tissue can also be destroyed with the Paquelin cautery, but when this is used the surrounding tissues must be very carefully protected from the radiating heat.

There are scarcely any fistulas that cannot be benefited by operation. There are many that cannot be cured, but all that I have seen have been benefited. I can recall several cases that are going about with a small sinus running high up, but yet are remarkably comfortable when contrasted with their former deplorable condition.

Dr. A. J. Downes: Neither of the gentlemen has referred to multiple fistulas. I recently had such a case in a tubercular woman forty-two years old. During the past ten years she had had four ischio-rectal abscesses that had opened, and numerous other phlegomons that had not opened. I operated on her four weeks ago at St. Joseph's Hospital. I found four fistulas. On the left, two, one close to the externa sphincter, and entering the bowel behind the internal sphincter; the second, an inch and a quarter from the margin of the bowel and entering the bowel an inch and a half from the anal margin. On the right side there were two, whose external orifices were two inches apart, and an inch and a half from the margin of the bowel. In operating I cut through the left side at right angles to the sphincter, and on the other side made a wedge-shaped incision, extending above the opening in the bowel, including both fistulas. I expected to cut the sphincter, on this side at a subsequent operation. Sixteen days later I etherized and found that I had succeeded in closing the internal openings on the right side. I had thus succeeded in one operation in curing the four fistulas with but one incison through the sphincter, nor can I see why it should be necessary to even cut the sphincter twice in any case.

On two occasions in the office, I have used the rubber ligature for fistula in otherwise healthy people, with excellent results.

Dr. J. M. Baldy: I have been somewhat surprised at the small amount of space that Dr. Wharton has given to excision of fistulas and to the utter condemnation of that treatment by Dr. Morton. My experience has been so contrary to this that it may be of interest to mention it.

In past times I have treated fistulas by cutting and packing, and I have seen a number of cases in which non-control of the sphincter continued for a long time. I then gave excision a trial, and I have never in a single instance regretted its use. Nor have I had a single failure in the ten to fifteen cases in which I have employed it in the last two years. In simple fistulas I have slit open the fistula, and with curette, scissors, or thin-bladed knife removed the indurated tissue, and then have placed sutures buried completely around the fistula; and have finally closed the mucous membrane, from the bowel, with catgut sutures. Where there have been multiple sinuses I have cut out all partitions between the sinuses. In one case the opening was one-half to three-quarters of an inch in width. I rubbed in a strong antiseptic solution, obtained primary union, and a perfect result. I remember a case in Trenton on whom a perineal operation had been done by a friend. This was followed by an ischio-rectal abscess with an opening into the rectum. The lady was also suffering from hemorrhoids. I laid the fistula open, exposing a cavity that looked most formidable. The slit in the bowel was probably two inches long. I curetted the cavity, rubbed in a strong bichloride solution, taking one-half to three-quarters of an hour, closed the wound with sutures, which did not go within an inch of the bottom, whipped the bowel together with catgut, and closed it without drainage, at the same time removing four hemorrhoids. Ten days later I removed the sutures, and in another ten days the patient was up and about, and the opening closed.

As I have said, in none of these cases operated on have I had cause to regret excision, and I should prefer it to all other methods where it was possible to introduce sutures, and nearly, if not fully, bury them all the way round.

In all my bowel operations I keep the bowels open from the first, and after the first passage the patients do not have much trouble. They are more comfortable than if they are permitted to have semi-hard discharges passing over tender surfaces.

Dr. Wharton: I am glad that Dr. Morton has called attention to the importance of using the bichloride solution so that none of it is retained in the rectum. I cannot say why it is that iodoform gauze is so exceptionally good a dressing in these cases, but it is certain that it does better than any other material. I also use the powdered iodoform.

Practically the second dressing is not a repacking. I simply pass a piece of gauze to the bottom of the wound and allow it to project between the edges. I have also used the method referred to by Dr. Morton without repacking.

I use the caustic potash in many cases, particularly where the walls of the sinus are very dense, but neglected to mention it in the paper.

In the chronic cases that have been operated on many times, I think that the great secret of treatment is thorough curetting and free drainage. If the sinus can close so that pus can accumulate, the patient suffers. If the drainage is free the patient is more comfortable.

In regard to double fistula, I spoke of this under the head of horseshoe fistula, and recommended one division of the sphincter at a time.

Dr. Baldy's results has been very satisfactory. I have myself not had a very extensive experience with excision. I meet with many cases in which the operation could not be satisfactorily accomplished, and in these I prefer incision.

If the bowels are moved promptly after the operation it is apt to disarrange the packing, and sometimes the first packing is important in controlling hæmorrhage from the wound.

MILWAUKEE MEDICAL SOCIETY.

Meeting of November 8th, 1892.

Dr. Lewis G. Nolte, Milwaukee, presented a "Report of Two cases of Nephrectomy—Recovery."—(See page 956).

DISCUSSION.

Dr. A. H. Levings: This paper of Dr. Nolte's I have been very much interested in. There are some points in it that might be well discussed, I think. In regard to the use of the aspirating needle, I believe in the majority of cases a diagnosis can be made without it; that is we can easily make a diagnosis of pus in the urine; but I believe also in the majority of cases, in fact nearly all, with the microscope if the

pus comes from the kidney you find the peculiar characteristic cell formation. Also if the abscess has extended into the kidney that you may get the cells of the different tubes. If the pus comes from the bladder wholly you will get the characteristic bladder epithelial cells. The rule is, so far as I know, in the microscopical examination of these cases, that if the pus comes from the bladder or from the kidney the cells characteristic of the source will predominate. Of course you always have more or less cystitis in cases of suppurated kidney, but if the pus comes from the kidney, and you are so to diagnose it, the cells must predominate over those of the bladder.

Whether to remove the kidney in the primary operation or not is a question. I think the majority of operators, Shape for instance, are very strong on this point—that unless you are sure that the abscess is tubercular the kidney should not be removed, but simply incised; see if you cannot save it and if the abscess will not heal. The majority of these cases are undoubtedly tubercular. I believe that is the case. And a tubercular kidney if it can be removed had better be removed.

In the removal of the eleventh or twelfth rib or both, as a rule, I think, that it is not intended in these cases to extend the incision up to the point of the ribs but the object is simply to get more space for retracting the wound. It is well known that the pleura extends half an inch below the twelfth rib, but by resecting the twelfth rib, you can open the wound further.

Dr. Nolte: I would say that finding out where the pus comes from does not tell us at all the vital point. It does not tell us which kidney is involved, and that is the most important point and that is where the aspirator should be employed. Why not operate on tubercular kidneys? I think the rule is as set down by S. W. Gross that you should operate in primary tuberculosis. I find from the literature that pyonephrosis is the rule and primary tuberculosis is the exception, contrary to the view apparently taken by Dr. Levings.

Again as to the point of the pleura extending below the twelfth rib, that is only once in a while the case. The rule is it does not extend further than between the eleventh and twelfth ribs.

Dr. H. M. Brown: I am quite astonished to hear Dr. Levings express himself as he has in the matter of the use of the aspirator. I do not see any good reason why you should not use the aspirator. It does not do a particle of harm—it cannot do any harm—and it gives you a certain means of diagnosis providing you have no better means at hand, I mean the method of seeing the character of urine coming from the different kidneys—and even then why should you not use the aspirator. One of the most prominent surgeons of the United States, Dr. Senn, was remarkably fond of using the aspirator and more than half of his diagnoses in regard to the extent or character of tumors was made with the aid of the aspirator needle, and I think if he were to tell the truth, as I am inclined to think he does as near as any of us do, that has helped him more than anything else. In the cystoscope a man has at hand a method of making an absolute and extremely early diagnosis as to which kidney is affected and how much. After once or twice using it, the urine can be seen trickling from the ureters into the bladder and can be seen uniting, when pus is coming from one kidney and clear urine from the other, with as sharp a line of demarkation as exists between the muddy waters of the Missouri and the clear waters of the Mississippi; and such means for diagnosing which kidney is afflicted, is certainly a most valuable one. It is a far prettier picture than the one I have spoken of, and I think it would be a very good plan for the gentlemen who have cases under their charge in which they suspect abscess or cystic pyosis, or degeneration of either kidney, to employ the means suggested for diagnosis. They may borrow my instrument and try it.

I was also astonished to find that Dr. Levings, unless I misunderstood him, thought it was not a good plan to operate on a tuberculous kidney. I do not know why we should not operate as quickly on that as on any tubercular cavity. Tubercular material is essentially a foreign body, and I see no reason why we should not operate at once on tuberculous kidney tissue, early if we can, late if necessary. Because a man has a few nodules in his lungs you should not hesitate to remove tuberculosis of the elbow or knee-joint. Why not remove the affected part as early as possible? And I think the consensus

of opinion, as far as my experience goes, is in favor of early and late operation upon tubercular diseases of the kidney.

Again, Dr. Nolte is more than right when he claims that the majority of cases of pus destruction of the kidney are not tuberculous. There is not one of us here who has not had in his post-mortem experience almost numberless instances where one kidney was almost entirely destroyed from the presence of stone and cystic degeneration of the kidney, which at some time had been an acute inflammatory trouble accompanied by pus and all the symptoms of pus infection, chills, fever, etc., and which if the kidney had been operated on and nephrotomy had been made, the kidney itself, or at least a greater part of it, might have been saved for further use; the cause of the trouble and some of the kidney would have been removed and a useful kidney would have been spared to the patient. In conclusion it seems to me that such grounds as Dr. Levings has taken in regard to the treatment of a majority of these cases should be avoided.

Dr. Levings: Dr. Brown has entirely misquoted me. What I said is that a tubercular kidney should not be drained, it should be removed—if I did not, that is what I intended to say.

Dr. Nolte: I would say in conclusion that my cases were both so far advanced that neither the cystocope nor any other means of determining from which kidney the trouble proceeded, was necessary. I had a tumor in each case and had no hesitancy in using the aspirator needle.

One of the most beautiful methods I ever saw employed was by Sabine in New York, in a case of Dr. Weir's. He introduced his hand into the rectum up to the sigmoid flexure and compressed the ureter. He could very easily compress either one of the two ureters at will, and in the mean time the urine which had secreted in the bladder was collected from the other kidney which secretes at the rate of a few drops every few minutes and a diagnosis was made out very easily. This was a case in which there was no tumor whatever and in which Dr. Weir subsequently operated and brought forth a kidney that was riddled with abscesses.

Dr. A. J. Burgess: I think Simon, of Heidelburg, was the man who first employed the method of introducing the hand into the rectum for the purpose of diagnosing kidney trouble; but it was found after he had used it awhile that the rectum was in such a dilapidated condition that it was not considered a very practicable method. A few rents with a few cases of death from peritonitis were the result.

In regard to the diagnosing of kidney troubles where there is a great deal of cystitis, by the use of the microscope, I must confess I have been pretty cloudy on the subject. I have a case now under torture, where I have examined the urine a good many times. I have found cells which one would ordinarily suppose came from the kidneys, but this case has been one of cystitis of three years' standing, and of course there has been a great deal of inflammatory trouble in the bladder, and the small cells from the new layers of epithelium in the bladder oftentimes are so like those in the kidneys that it certainly takes an expert to know the difference; and then supposing you have the trouble arising from a stone which has become impacted in the ureters—what good are you going to do with your microscope? You may perhaps have trouble with the bladder also; the ureters may be stopped up and no urine or but very little coming down and that intermittently; you are at sea again. You may think you have cells which come from the kidney which really did not because they could not.

In regard to the use of the cystoscope, if we were going to borrow Dr. Brown's, I should want to borrow Dr. Brown also. The statements I have heard in regard to the cystoscope are entirely at variance with Dr. Brown's statement; and Finger, of Vienna, says it is much harder to learn to use than is the ophthalmoscope and much more uncertain in its results. Dr. Dietel, seventy-four years of age, and a specialist on genito-urinary diseases, used the cystoscope at first for a good while, but practically only to make demonstration of its use rather than to make diagnoses with it. He thinks that the ordinary symptoms and the experience he has had, will lead him to more correct diagnosis ordinarily than will the systematic use of the cystoscope. That instrument was used considerably two years ago, and I remember one man who was quite an enthusiast who had discovered an instance of stone by the use of the cystoscope and another instance of

tumor; but on opening the bladder to remove them there was nothing found.

The method of catheterizing the ureters also has been used to some extent; and in that connection I remember to have seen Eberson, of Copenhagen, trying to catheterize the ureter in a woman and he worked at it an hour and finally got the catheter into the uterer but no urine ran out. He drew it out and found it was plugged with a clot. He "monkeyed" around for an hour and got it in again but it plugged right up again with another clot. And, after an hour and a-half the ureter had to be incised to admit his finger. Of course in the male the operation is still more difficult.

In regard to the removal of tuberculous kidneys, it would be a very good thing to do always, of course, if you could be absolutely certain there was no such trouble in the other kidney. There apparently is no reason theoretically why one kidney should be infected much sooner than the other. Of course it does so happen often, but oftentimes the affection is coincident, and there is no way of being absolutely certain in regard to it. So some operators have been in the habit of doing first a nephrotomy to see if that would perhaps relieve the patient, and, if not, and the other kidney was found to be in good condition, later, through watching its functional activity, a secondary nephrectomy could be made. Practically it is difficult to do that on account of the large amount of scar tissue that is apt to form.

In regard to the resection of the ribs, I have seen that done once only and it seemed to me that there was no space whatever gained by the resection; at least it brought the operator to no result and did not seem to give any more room in the place where room was wanted than he had before.

Correspondence.

CATHETERISM IN THE FEMALE.

Editor of The Medical and Surgical Reporter:—My attention has been called to this subject by remarks made on the style of catheters to be used in the female subject, on page 908 of Medical and Surgical Reporter, of December 3d, '92. The most frequent use I have found for catheterism in the female is previous to and during the first stage of labor, especially in *primiparæ*. During a long, varied and quite extensive practice as a country obstetrician I invariably examine the suprapubic region in order to ascertain whether or not the bladder is full. I claim that it is not at all uncommon to find the viscus distended with urine, which in my opinion is caused by partial paralysis of the constrictor muscles at the neck of bladder superinduced by pressure of the gravid uterus, and in *primiparæ*, a general compactness of the pelvic ligaments, bones and tissues. I agree with commentator in the article above referred to that "the straight tube is preferable to the curved one in women." It is easier of introduction, more thoroughly aseptic, and foreign matters are more easily eliminated through it. Another advantage is that it can, if not too long, be introduced in *almost* any position of the patient. I have never used a glass catheter, but can see no particular advantage in them. The one I have found most convenient is Tiemanns' soft rubber catheter stiffened *for introduction*, with a wire. I always use a No. 10 or No. 12. I often use a gum elastic catheter which is always destroyed when no longer needed. The same catheter is never used in two subjects. Another point is that after using them I always clean my catheters by placing them with other instruments in a hot solution of carbolic acid, forty per cent. and allow them to remain in it for about a half an hour. I have never, in these cases, used the double current catheter. At some future time I shall have more to say on the subject of catheterism in the male.

Respectfully yours,

A. O. Stimpson, M. D., C. M.

Thompson, Pa. Dec. 7th, 1892.

CATGUT AS SUTURES.

Editor of Medical and Surgical Reporter:—In your issue of Nov. 12, there appears an abstract of a paper originally published by Klemm, in the *Bulletin Generale de Therapeutique*, in which strong condemnation is made of the use of catgut in surgical practice. From an extensive experience, both experimental and clinical, I am sure the deductions of Klemm are absolutely false and therefore misleading. Soon after the publication of

the paper in question Dr. J. F. Binnie Professor of Surgical Pathology in the Kansas City Medical College, and myself undertook some experimental work to determine the comparative value of catgut, silk, silver wire, silk-worm gut and kangaroo tendon—particularly as regards the setting up of suppurative or other infectious processes in wounds. The results conclusively prove the inaccuracy of Klemm's observations, provided sterile gut is used under perfect aseptic conditions.

As to the statement of Klemm that "when catgut is employed in surgery suppuration occurs in spite of all precautions," I knew from long experience that it was not true, but decided to make a careful series of observations, assisted by Dr. T. B. Thrush, House Surgeon at All Saints Hospital, Kansas City. So during the past few months close watch has been kept on 8 cases of trephining for idiocy, epilepsy, tumors of brain, etc.; 9 laparotomies for pyosalpinx, ovarian tumor, etc.; 4 abdominal hysterectomies; 2 gastrostomies; 4 recent perineorrhaphies; 1 removal of the Gasserian ganglion; 2 excisions of the ankle; 4 amputations; 1 Wyeth's amputation at hip; 2 club-foot operation in which excision of bone was made; 3 excisions of cancers; 3 herniotomies; 2 varicoceles; 1 trephining the spine; and 2 castrations. In cases of cystotomy, prostatotomy, excisions of ribs, amputations for injury, operations on the rectum, the perineum, etc., no attempt was made to use catgut since the field of operation could not be rendered aseptic. In the 48 cases here mentioned more or less pus formed in three cases: (1) a case of tuberculous empyema of the ankle; (2) in an amputation where carbolized gut had to be used instead of juniper-oil gut; (3) in the laminectomy for extra-dural tumor producing paraplegia, when the incision was through a large bed-sore not properly cleaned. The remaining 45 cases completely annihilate the anti-catgut men—there is no way of escape.

Any surgeon who will take the pains to clean his field of operation by carefully scrubbing with soap and brush, drying, washing with sulphuric ether, applying a saturated solution of permanganate of potassium until the parts are stained a deep mahogany color, decolorizing with a strong solution of oxalic acid and finally douching with solution of bichloride of mercury, will have a surface upon which he may use as much catgut as necessary without the slightest fear of suppuration, providing the hands are thoroughly disinfected by the same process, all instruments boiled for 20 minutes in a 5 per cent solution of carbonate of sodium just before using, and a good catgut be employed. Carbolized catgut is unreliable, even dangerous: juniper-oil gut, properly prepared, is absolutely safe.

Very truly yours,

EMORY LANPHEAR,

Kansas City, Mo. Dec. 6, 1892.

STERILITY IN THE MALE.

Dr. L. Seeligmann states that matrimonial sterility caused by the husband may be due to the following causes:

1. Impotentia coëundi.
2. Aspermatism.
3. Azoospermia.

Of these three causes of male impotency, the comparatively rare condition of impotentia coëundi, and the almost equally rare condition of aspermatism, we may pass by and proceed to a consideration of azoospermia as the most frequent cause of sterility, or rather impotency, in the male.

Azoospermia, or a change in the ejaculatory fluid in which both quantitatively and qualitatively the semen is apparently normal, but in which the most important element, the spermatozoa are absent, can be caused by the following:

1. Stoppage of the vasa deferentia in consequence of inflammation or traumatism.

2. Nutritive disturbances of both testicles:

a. Occurring after funiculitis, epididymitis, and duplex orchitis.

b. From constitutional diseases; syphilis, tuberculosis, chronic alcoholism, diabetes mellitus, etc.

c. From varicocele, hydrocele, kryptorchismus.

3. Atrophy of the testicles:

a. After sexual excesses.

b. After long indulgence in onanism.

c. After injury to certain parts of the brain, especially of the cerebellum.—*Weekly Med. Review.*

THE
Medical and Surgical Reporter

ISSUED EVERY SATURDAY

ADDRESS:
Care P. O. Box 843, Philadelphia

PENFIELD BROS., Publishers.

NOTICE TO CONTRIBUTORS.

We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

Terms. Five dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

Remittances should be made payable only to the publishers, and when in sums of five dollars or less should be made by Postal Note, Money Order or Registered Letter.

THE MEDICAL AND SURGICAL REPORTER.

SATURDAY, DECEMBER, 17TH, 1892.

SOME SIGNS OF THE TIMES.

"If the profession is to rise in the estimation of the public, the portals must be narrowed, and the evidences of the capability for entering a highly honorable and terribly responsible profession must be made more and more stringent. The neophyte must not only know, he must be able to put his knowledge into practice before he is let loose to command the issues of life or death. And I hold there is no plan surer to bring about this condition of things than to set the learner to try to do the work for himself, as is the almost invariable rule in every line of life, under proper and responsible supervision."

This is the conclusion of a strong letter from Dr. Bruce, Direct Representative for Scotland on the General Medical Council, to the *British Medical Journal* (Nov. 26 '92). He is urging the necessity of higher education in the medical profession of Great Britian. In that country, with its profession jealously supervised by a General Medical Council of great powers, with that insular tendency to introspection yclept conservatism, with its ancient and honorable institutions of learning, no sooner has the five years' curriculum been established than the cry is made to raise yet higher the standard of the profession.

In painful contrast to this an editorial in *Daniel's Texas Medical Journal* (Nov. '92) affords an illustration of a standard of medical education that will meet legal requirements in some parts of this country. Unfortunately the illustration could apply to the majority of the States and Territories of the Union,—even to Pennsylvania. Speaking of the mortifying lack of success of the Texas Medical College, the editor says:

A magnificent building was constructed, and every department thoroughly equipped for teaching modern medicine. An able faculty was secured, and a high and thorough curriculum was arranged, extending over three years' graded courses. No longer should it be a reproach to Texas that with her princely school fund and her university, where all else is taught, her sons were compelled to go abroad for medical education. After ever so many obstacles overcome, at last the doors of a magnificently prepared medical college were thrown open and students were invited to come in. They didn't come. * * *

Let it be understood that in this State a *diploma* is a *diploma*. There is no discrimination observed whatever, and practically one diploma is as good as another. A man who can go into almost any Southern city, and after three months attendance on lectures, return to Texas and begin practice; or who can go, it may be, without intermission, from a three months' course at a winter school (which has cost him, say $50 for tuition), right into a summer school, where after three months more and another $50 fee, he can secure a diploma which will entitle him to recognition by the profession and all the rights and privileges of a legal practitioner of medicine in Texas, can hardly be expected, in these days, to sacrifice so much to patriotism as to attend three years at a home school and pay $140 each year unless, thereby, he could secure a diploma which would give him certain advantages over the cheaper sort; in brief, Texas cannot expect to keep her students at home so long as a diploma from a two

year school and $50 fees is put upon the same footing before the law. * * *

Every effort to secure legislation which will require something more than the mere possession of a diploma (from any source) as a requisite to the privilege of practicing medicine in Texas, has been laughed to scorn. And now, the senators who mocked those efforts are confronted with a problem hard to solve, and they must take their choice between keeping up a costly establishment and paying a teaching corps high salaries to lecture to empty benches—or they must offer Texas students other inducements, or protection from competition with cheaply made doctors. The first thing to be done, in our opinion, is to reduce the cost of lectures to the matriculation fee and anatomical fee only. If then our five hundred students still refuse to be highly and thoroughly educated, pass a law which will admit to practice in Texas no man whose diploma has been issued by a school requiring less than is required at Galveston.

However, the situation is not so hopeless as if relief were entirely dependent on the Legislature. Experience has constantly shown that, in the onerous duties of saving the country, the law-makers can spare but little time in considering matters in which they can discover no prospects of immediate beneficial returns. Only by patient and persistent effort can they be educated to an appreciation of the importance of allowing none but men of the highest grade of ability and education to deal with issues of life or death among their families and friends.

Six months' attendance on lectures (!) and $100 will obtain a diploma in "almost any Southern city,"—a condition of affairs not confined to Southern cities. A bitter caricature of American Medical Science.

Southern practitioners are fully alive to the situation. In some States, notably Virginia, they have secured legislation which will go far to extirpate the reproach of "diploma mills." But impatient of the tedious process of law-making they have devised a method which will greatly hasten the growth of public opinion necessary to compel the desired legislative action, meanwhile working mightily to advance medical education.

In a private letter, Dr. Luther B. Grandy, editor of the *Atlanta Medical and Surgical Journal*, who has been actively identified in the movement, says "Some of us down here have been engaged in proclaiming the gospel of a higher education, and recent events encourage us to hope that our labors will not be in vain. The Southern Medical College Association was inaugurated the other day and many of the evils which have existed heretofore in our educational system we are persuaded may now be corrected. We propose to keep up the fight until the desired results are obtained, or at least until better conditions prevail than at present. The improvement in our system of medical education down here, the lengthening of our terms, the increased requirements both for matriculation and graduation, is a consummation devoutly to be wished. This will give us better schools and better doctors." These are the sentiments of all of the progressive men in the South, and the influence that will be exerted by the association will rapidly make itself felt throughout the entire section. We give below a schedule of the organization of the Southern Medical College Association.

RULES AND REGULATIONS

FOR THE ORGANIZATION AND MAINTENANCE OF THE SOUTHERN MEDICAL COLLEGE ASSOCIATION.

This Association shall be composed of delegates from Southern Medical Colleges, whose Faculties have signified a desire to become members thereof, signed these rules of organization, and paid the membership fee of $5.00.

The objects of the Association are to cultivate closer and more intimate relation between medical colleges and to elevate the standard of Medical Education by requiring a more thorough preliminary training and an increased length of medical study.

The Association shall be composed of one or more delegates from each Medical College, belonging thereto, who shall be elected annually by their respective faculties. Each college shall be entitled to one vote in the transactions of the Association.

The officers shall consist of a President, Vice-President, Secretary and Treasurer, who shall be elected annually, just before the adjournment of the annual meetings, and shall perform the respective duties, pertaining to these offices in similar organizations.

The meetings of the Association shall be held at the same time and place of the meetings of the Southern Surgical and Gynecological Association, unless otherwise determined by the Association.

REQUIREMENTS FOR MATRICULATION.

Every student applying for matriculation must possess the following qualifications:

He must hold a certificate as the pupil of some known reputable physician, showing his moral character, and general fitness to enter upon the study of medicine.

He must possess a diploma of graduation from some literary or scientific institution of learning, or certificate from some legally constituted High School, general Superintendent of State Education, or Superintendent of some County Board of Public Education, attesting the fact that he is possessed of at least the educational attainments required of second grade teachers of public schools. Provided however, that if a student so applying is unable to furnish the above and foregoing evidence of literary qualifications, he may be permitted to matriculate and receive medical instructions as other students, and qualify himself in the required literary departments, and stand his required examinations as above specified, prior to offering himself for a second course of lectures.

The foregoing diploma or certificate of educational qualifications, attested by the Dean of the Medical College attended, together with a set of tickets showing that the holder has attended one full course of medical lectures, shall be essential to attendance upon a second course of lectures in any college belonging to this Association.

BRANCHES OF MEDICAL SCIENCE TO BE INCLUDED IN COURSE OF INSTRUCTION.

Anatomy, Physiology, Chemistry, Materia Medica and Therapeutics, Theory and Practice of Medicine, Pathology, Surgery, Obstetrics and Gynecology, Hygiene, Medical Jurisprudence (Forensic Medicine) and special Laboratory work as hereinafter provided.

QUALIFICATIONS FOR GRADUATION.

Candidates for graduation in addition to the usual requirements of Medical Colleges, must have attended three courses of lectures of not less than six months each in three separate years:

Must have dissected in two courses, and attended two courses of clinical or hospital instructions.

And must have attended one course in each of the special Laboratory departments to wit:

1. Histology and Bacteriology.
2. Chemistry.
3. Operative Surgery.

These requirements shall not apply to any student who has received a course of medical lectures prior to September 1, 1892.

M. T. Briggs,
J. B. Marvin,
J. S. Cain. } Committee.

The . . . . . of . . . . . agrees to the above regulations and thereby becomes a member.

. . . . . .

. . . . . .

CHRISTOPHER (W. S.) ON RETAINED FÆCES.

The following conclusions are submitted:

1. Long continued partial retention of fæces is common.
2. Such retention is usually harmless.
3. Retained fæces undergoing putrefaction may, at any time, acquire poisonous properties.
4. Retained fæces may produce either local or constitutional symptoms.
5. The principal local conditions produced by retained fæces are typhlitis, appendicitis, and peritonitis, either localized or general.
6. Retained fæces, through the poisons produced in them, are capable of causing any constitutional symptoms which can be manifested through the agency of the central nervous system.
7. Among the toxic effects of such stercoræmia may be mentioned fever, convulsions, coma, insomnia, headache, neuralgia, vertigo, anæmia, diarrhœa, constipation, incontinence of urine and fæces, insanity, etc.—*Journal American Medical Association.*

Translations.*

By MARIE B. WERNER, M. D.

Dr. J. G. Master of Kiew, (*Jahrbuch f. Kinderheil 34, 1892.*) earnestly recommends the use of phosphorus for rachitis coincident nervous phenomena, he prefers the oil of sweet almonds rather than Cod Liver oil as a menstruum.

℞ Ol. Phosphorat offic. (1:80)..... gtts. x.
Ol. Amygdalæ dulc. 13
M. Sig.—10 drops once or twice daily for children of 2 to 3 years.

Dr. Karl Gebb (*Inaug. diss. Würtzburg, 1892*) presents the clinical history of 21 patients suffering from benign neoplasms of the larynx, observed by him at different clinics.

Seven cases of fibroma; these were usually isolated and located on the free border of the vocal cords, between their anterior and middle thirds—the age of the patients ranged between 24 to 48 years.

In 9 patients aged respectively between 10 to 64 years cysts were observed on the epiglottis, the arytenoid and pharyngo-epiglottidean folds and the vocal cords. In only two of these cases, hoarseness as a symptom, led the physician to make a local examination, the other were casually found in making examinations. Angioma was found once, in a man of 65 years who had been hoarse for one and one-half years previously. It was located in the R. sinus morgagni.

Four cases of papilloma (in two men and two children.) One of the children died shortly after tracheotomy had been performed from pneumonia.

In the three other cases numerous returns were observed after removal by either the endolaryngeal method or by the laryngo fissure.

Falkenheim and M. Askanazy (*Jahrbuch f. Kinderheil 34, 1892*) reports a case of perforative peritonitis in the newborn with calcareous degeneration of the extravasated meconium. The child born by the breech, with subsequent extraction of the head, showed marked tympanitic distension of the abdomen. A puncture made five days after birth was followed by the escape of large quantities of gas, affording temporary relief but cyanosis and death occurred on the twenty-third day. The most prominent symptoms were vomiting and eructations but apparently no abdominal tenderness.

Post-mortem examination revealed a large quantity of gas in the abdominal cavity, the peritoneum was covered with a fibrinous coating undergoing suppurative changes, numerous small nodules were noticed principally in the region of the flexura coli sinistra. At this point the colon presented a funnel-shaped depression having at its deepest point an opening the size of a pin's head. The hard nodules contained calcareous matter. After dissolving these calcified particles examination showed that they contained epithelial cells, cholestrine, bilirubin and isolated hairs, this proved the nodules to consist largely of calcified meconium. The authors deduct from this that the perforation occurred at a time when the intestine contained only meconium, but after birth, the meconium containing bacilli; this he considered to be the cause of the peritonitis.

Von Dübler and Genserich have described similar cases.

Dr. G. Dittrich (*Deutsch Zeitsch f. Chirurg.*, 33, 1891) has contributed an interesting article on the subject of "Statistics of Mammary Cancer."

The material which has furnished subject matter for his studies was derived from the Strassburger Surgical Clinic. During this time 110 cases of mammary carcinoma were seen; 107 among women—three among men. The author received definite answers from eighty-two of these in making his inquiries. Ten died at the hospital and were examined post-mortem.

The ages of the patients ranged mostly between forty-six and fifty years.

As aids to the cause D. recognizes on the one hand the absence of the physiological activity of the gland, or, again an over-stimulation of its functions.

In twelve cases mastitis preceded the malignancy, six times in the gland so affected, five times in both mammæ and once in the healthy breast. In ten cases trauma acted as an immediate causative factor. In three cases eczema and fissures were noticed. Six patients gave a distinct history of heredity.

*Translated for Medical and Surgical Reporter.

Anatomico-pathological investigations proved the scirrhus variety the most frequent.

In seventy-eight cases the integument was infiltrated and involved; only in seventeen the skin remained free. In seventy-one females the axillary glands were found infiltrated; in twenty-four they were intact. The tumor was adherent to the pectoralis major in twelve cases and in eighteen its surface was ulcerating.

In ninety-eight cases the total amputation of the mamma and thorough clearing of the axillary space was practiced—only twice was the tumor alone removed, both live still, one eight years, the other five and a half years since the operation, with no signs of return. Five patients were inoperable. The returns which presented themselves after the operation were removed in thirteen patients.

Of the 104 operated cases, there were eight deaths. Of the ninety-five discharged cured, eighty answered the written communication; 23=28.7 per cent. were still alive. Thirteen can be regarded as cured, 16.3 per cent., by this the author means no return since within the space of three years. In nine of these, four to ten and a half years have elapsed since the operation.

Of the three male patients, one died of erysipelas; one died two and a half years after operation of pneumonia; one had a return which was removed, the patient was then lost sight of

---

"A Contribution to Internal Surgery," by Prof. Edin Rose (*Deutsch Zeitsch f. Chir.* 34, 1892). The author has for the space of nearly 30 years, studied the question of symptoms of rupture of the stomach as a result of gunshot wounds, and internal injuries.

In the last two years Rose has had the opportunity of performing cœliotomy in two patients suffering from such an injury and presents now the interesting history of his patients.

Male, æt. 20, fell from the roof of a three-story house and sustained a severe concussion of the brain and fracture of the skull together with other injuries. He vomited twelve times dark colored blood during the first two days.

The abdomen was much distended, sensitive laterally and dull on percussion. Rose thought of possible rupture of the intestines, but desisted from performing an operation because the patient was unconscious and later because there was a normal discharge of natural colored feces. The patient was discharged after two months, apparently in good health, but returned a month later suffering from ileus. A mechanical obstruction seemed to be the cause and Rose advised laparotomy. An abscess of the liver was found occupying almost the entire left lobe, adherent to the stomach and indirectly to the transverse colon—the increase of this abscess formed the stenosis from which the patient was suffering, its evacuation and fastening the abscess walls to the incisions, resulted in recovery.

Second case: The patient, aged 24 years, was thrown out of a freight car, and fell with his left side upon the sharp edge of a board fence. Vomiting the contents of stomach mixed with blood, at once set in, and was promptly followed by vomiting of clear blood. One finger's breadth above the umbilicus could be seen or felt a depression, above this the abdomen was seen bulging forward containing liver, spleen and stomach, but in this swelling their outline could not be distinguished by the percussion note. On the 14th day, a section was performed and a rupture of the pancreas and posterior wall of the stomach. Through the rupture of the stomach the remainder of its contents had entered between the omental layer, making a tumor between the pancreas and stomach. The blood and pancreatic juice aided to produce an inflammation in this sac, by which the foramen of Winslow was closed. This case also recovered.

These two cases have taught the author to regard the continued vomiting of blood after injuries from a previously healthy stomach, as a pathognomonic symptom of rupture of the stomach.

Injuries to large venous trunks treated by lateral closure. Dr. Niebergall, of Marburg (*Deutsch Zeitschr f. Chirurg.*, 23, 1892). The various methods taught at Kuster's clinic, for the arrest of hæmorrhage in injuries to large venous trunks are: first, *compression*, sometimes *tampon*. Second, *lateral ligature*. Third, *suturing the vein*. Fourth, *lateral compression by means of forceps temporarily left in situ*. The experience of Niebergall by compression or tamponing in minor injuries to

venous trunks is, that this method often produces union minus any great reduction in the calibre of the vessel. More extensive injuries however require a different course of treatment, since there is little hope of retaining its lumen, as well as the possibility of non-arrest of hæmorrhage; this is especially true of such veins as the femoral where the collateral circulation is not so fully developed.

In bleeding from eroded veins the antiseptic tampon may prove of service.

Lateral ligature has proved successful in Niebergall's hands with, however, some diminution of the lumen of the vessel at the space ligated which increased in direct ratio to the amount of venous wall enclosed in the ligature. The objections to this method are: primary hæmorrhage due to the ligature slipping, this is often prompted by an unavoidable shortening of the vein in its ligation, this danger is less when the wound has occurred at a place where another vein joins it. Any abnormal or pathological changes of the walls of the veins, frequently favor the cutting through of the ligature.

Suture of the vein. Niebergall reports ten cases collected from medical literature. From these he forms the following conclusions: This method is peculiarly adapted to injuries in the long or transverse axis of the vessel, and the results have been superior to those of the former method, since there is less danger of primary hæmorrhage, and the lumen of the vessel is not so much diminished, the adaption of the wounded edges promises better and more lasting results. Two important points must enter into the consideration for the use of this method, in order to attain the above results, i. e., antisepsis, and healthy venous walls.

Lateral and total compression by means of forceps left in situ:—Niebergall reports fifty-three cases, and gives the following conclusions: This method is thoroughly reliable and in the presence of strict antisepsis, gentle and careful removal of the forceps after twenty-four hours, secondary hæmorrhage seldom, if ever, occurs; the lumen of the vessel is retained, since the forceps favor adhesive union of the inner coat, which is of sufficient firmness to hold until complete cicatrization has taken place, this usually occurs in about fourteen days. The author prefers to use Pean's forceps.

Dr. Passet, of Munich, (*Munch. Med. Woch.* No. 32, 1892) presents under the head of, "Legal Responsiblity of the Physician Administering Chloroform or Other Anæsthetics," the following rules for its safe administration, based upon his own experience and that of others: (1) A thorough knowledge of the general health, condition of the circulatory and respiratory organs is imperative. The urine should be examined. An injection of morphia should precede operations of longer duration. This will diminish the quantity of chloroform necessary. In organic disease of the heart, a combination of ether and chloroform, or ether is to be preferred, and lastly, local anæsthesia is to be preferred in smaller operations,—the use of bromide of ethyl; (2) in cases where grave changes are present in the circulatory or respiratory organs, or if asphyxia is present through obstruction in the air-passages, anæsthesia is not admissible; (3) chloroform should never be administered during digestion; artificial teeth should be removed; the patient placed on his back during the early stage of narcosis, to be changed later as needed; (4) only chemically pure chloroform should be used; (5) chloroform should always be given with sufficient air; it should be used in drop doses; any apparatus which combines chloroform with a proper amount of air is to be recommended; (6) during the operation it is imperative to watch the circulation and respiration. If possible the pulse should be recorded by an assistant; arrest of heart's action, or asphyxia must be treated promptly; (7) when complete narcosis has set in, small quantities at longer intervals are indicated.

The physician can only be held responsible for untoward results if any of the above directions have been overlooked.

Kronfeld reports a case of poisoning by antifebrin taken with suicidal intent. (*Wiener Med. Woch.*, No. 38, 1892) Male; æt. twenty-four; swallowed twelve grammes at one dose. He at once became drowsy, and soon marked cyanosis set in. Injections of ether and lavage of the stomach with cold water revived the patient, and in a few days he recovered. The antifebrin was eliminated chiefly in the urine. The temperature was persistently low.

Abstracts.

TUBAL MOLES.

In the *Lancet*, November 12th, Dr. Bland Sutton, of London, gives an interesting illustrated article upon this subject. He says, in part:

Tubal moles differ from uterine moles in several particulars—indeed the points are such as to enable us readily to tell one from the other.

The uterine mole is more or less spherical; the amniotic cavity is of fair size and occupies the center of the mole. The embryo may, or may not, be present. Sometime s it is represented merely by an ill-shaped mass pendulous at the end of the cord. Even when the embryo can be recognized it is very misshapen, and the umbilical cord is often œdematous.

A tubal mole in its early stage is spherical, but, after attaining the dimensions of a walnut, becomes ovoid. In the majority of cases the amniotic cavity occupies an excentric position. In consequence of this peculiarity the thin amnion is easily ruptured and permits the escape of the embryo. This explains the difficulty of finding the embryo in many cases where the mole has been discharged through the rent in the wall of the tube or aborted through an unclosed ostium, accompanied, as the rule is in these cases, with free hæmorrhage. The mole is easily found in the clot, but if the embryo has escaped from the amniotic cavity the chances are that it will not be recognized. It must not be imagined that because the embryo has not been found it has been dissolved by the peritoneum. On one occasion I collected all the blood and clot which I removed during an operation five weeks after the rupture of a gravid tube, and disintegrated it by a gentle stream of water. In the course of this manœuvre the embryo came to the surface, was recognized and caught. As is the case with uterine moles, the embryo sometimes dies very early, and the amniotic sac contains nothing but a small quantity of fluid. When the mole, on its escape from the tube, is discharged between the layers of the broad ligament it becomes so compressed that the embryo is found flattened out like a succulent flower firmly squeezed between the layers of a heavy book.

It will be necessary to offer a few remarks on the recognition of a tubal mole. When a mole is found with an embryo in the amniotic cavity there cannot be any room for dispute. The same holds good for moles with amniotic cavity, though no embryo is present. In hard firm clots in which the amniotic cavity is not recognizable, sections from the supposed mole must be prepared and examined with a microscope for chorionic villi. The presence of chorionic villi are as indicative of a mole as of the presence of an embryo. These villi are such characteristic structures that they cannot be confounded with "half-organized blood," as some writers have suggested.

It is of great importance to appreciate clearly the character of a tubal mole, for the presence of a mole is decisive proof of pregnancy.

It will, perhaps, be useful to offer a few remarks on decidua. When a fallopian tube becomes gravid a decidua forms in the uterus, and this curious structure has a diagnostic value. This decidua is rarely retained until the completion of gestation and thrown off during the false labor. Usually it is discharged during the early period of pregnancy in small fragments, without producing pain, or else it is expelled *en masse* with symptoms of miscarriage. When a gravid tube ruptures or aborts, the uterus becomes disturbed and the decidua is expelled. When a decidua is expelled whole it represents a cast of the uterine cavity. It is in shape pyramidal; the base corresponds to the fundus of the uterus, and at each angle there is an orifice corresponding to the uterine opening of each fallopian tube. The apex of the pyramid is occupied by a circular hole, corresponding with the dilated internal orifice of the cervical canal. This is smooth and rounded, whilst the smaller orifices corresponding to the uterine ends of the tubes are ragged. The exterior of the decidua is shaggy, the interior smooth and dotted with many minute puncta, representing the orifices of the uterine glands.

There is little doubt that the majority of cases formerly classed as pelvic hæmatoceles are in reality the result of rupture or abortion of gravid tubes. The cases in which doubts arise are those in which women are seized with symptoms indicating internal hæmorrhage. On opening

the abdomen free blood is found, often in abundance. The tube is widely dilated, perhaps ruptured, and clots of blood hang about the fringes, yet no embryo is detected. In some of these cases a decidua is discharged from the uterus. These doubtful cases will become fewer as operators become familiar with the tubal mole. The mole is so different from ordinary clot that there should be little difficulty in distinguishing it, except in cases in which it is very small.

The following is a summary of the views contained in this paper: (1) The transformation of a tubal ovum into a mole or apoplectic ovum is beyond doubt; (2) the majority of specimens described as examples of hæmato-salpinx are gravid tubes; (3) rupture of a gravid tube and tubal abortion are the common causes of pelvic hæmatocele; (4) mesometric rupture of a gravid tube is a common cause of pelvic hæmatoma; (5) to affirm that bands of fibrin resemble chorionic villi indicates great want of histological knowledge; (6) every clot of blood found in a fallopian tube is not a tubal mole.

Since the discovery of the tubal mole, specimens of non-gravid fallopian tubes are found to be so infrequent that in the last report of the museum of the Royal College of Surgeons I notice an account of "an unequivocal example of hæmato-salpinx." This is a fair indication of the revolution which has taken place in our knowledge of the early stages of tubal pregnancy.

TREATMENT OF ANEURISM AND OF HÆMORRHOIDS, BY HYPODERMIC INJECTIONS OF BLOOD CLOT.

Dr. G. K. Turner, in a paper read before the East Tennessee Medical Society, thinks that this method gives promise of great usefulness.

"As there is no possible method for treating aneurisms that does not involve either clotting of the blood in the aneurism sac or obliteration of the artery, there can be no valid objection *to clotting blood outside of the artery and then introducing it*, where required, by hypodermic syringe."

His plan is, after thorough asepsis, to draw blood from patient's arm, or from the arm of a friend, and clot this blood, or allow it to do so spontaneously. Then strain off the serum and inject at the distal side of the aneurism, first deadening the skin with a four per cent. solution of cocaine. He recommends that the current of blood in the artery be checked by tourniquet or manual pressure beforehand, and the aneurism filled at one injection.

He also proposes the same clot injection for hæmorrhoids in place of using astringents or carbolic acid, which do no more than produce a clot. "Why not use a clot at first hand."

A CASE OF GOITRE CURED BY GALVANISM AND SYRUP OF HYDRIODIC ACID.

Dr. W. C. Wile reports in Nov. No. of the *New England Medical Monthly* a case of goitre which recovered in eight months, under treatment.

The patient, a lady; æt. thirty-seven, mother of four children, had a severe attack of LaGrippe followed by pneumonia. Convalescence was long and tedious. She then noticed palpitation of heart, indigestion, insomnia and extreme nervousness. A careful examination revealed no organic heart disease, but it was found that all of her symptoms were due to a commencing Graves' disease.

She had the enlargement of the thyroid gland, exophthalmia, and all of the nervous phenomena.

The bowels were regulated, and patient given a plain nourishing diet, including sherry wine, sulphonal was given for insomnia.

From eight to ten cells of the galvanic current were administered, placing the positive pole inside the left ear, and the negative over the seventh cervical vertebra applying the current for twenty minutes, each day. Internally, she was given syrup of hydriodic acid, in teaspoonful doses, t. i. d., which was gradually increased, until two tablespoonfuls were taken at one time, t. i. d. Then the dose was reduced, to the original teaspoonful, which she continued taking for seven months.

Improvement was immediate and rapid. The galvanism was stopped at the end of the month, while the syrup of hydriodic acid was continued.

She was discharged perfectly cured.

Selected Formulæ.

TREATMENT OF CARDIAC ASTHMA.

Dr. Ferrand (*Le Bulletin mèdical,*) recommends the following treatment:

General treatment:

1. Each morning two soup-spoonfuls of:

℞ Iodide of sodium..... 25 grams. (ʒ vj).
Infusion of elder flowers..... 300 grams. (fl. ʒx).

2. Every evening, before eating, two soup-spoonfuls of:

℞ Bromide of sodium..... 25 grams. (ʒvj).
Syrup of aconite..... 50 grams. (fl. ʒjss).
Infusion of hops..... 250 grams. (fl. ʒviij).

Treatment of the crisis:

1. Place the hands in a dish of hot water.
2. Give inhalations of ammonia.
3. Give every five or ten minutes five drops of:

℞ Laudanum..... 4 grams. (fl. ʒj).
Cherry laurel water..... 6 grams. (fl. ʒjss).

4. Inject subcutaneously the following:

℞ Atropine sulphate..... cgms. 1 (gr. 1-6th).
Morphine sulphate..... cgms. 2 (gr. ⅓).
Cherry laurel water..... cgms. 10 (fl. ʒijss).

During the intervals one may employ the following means:

Administer each day before the two principal meals a spoonful of:

℞ Iodide of potash..... 20 grams. (ʒv).
Syrup of capillaire..... 125 grams. (fl. ʒiv).

Morning and evening take one of the following pills:

℞ Ext. of stramonium, } aa cgms. 1
Valerianate of zinc, } (gr. 1-5).
Sufficient for one pill.

Every two days take:

℞ Syrup of buckthorn..... 30 grams. (fl. ʒj).

—*Lan. Clin.*

FOR PRURITUS ANI.

An ointment containing:

℞ Creasote or carbolic acid..... 1 dram.
Lard..... 2 ounces.
Camphor..... 1 dram.

Applied topically, is a safe and often effectual remedy for the relief of pruritus ani.—*News.*

ACUTE CORYZA.

Dr. Capitan recommends the following snuff to be used every hour for the relief of acute nasal catarrh:

℞ Salol..... ʒ ss.
Salicylic acid..... vj. grains.
Tannin..... iij. grains.
Boric acid..... ʒ ij

The use of this powder should not be continued for more than a few hours, as it is apt to excite a slight eczematous eruption along the edges of the nostrils. The following is another formula, less active, yet said to have given good results:

℞ Powdered talc..... ʒ j.
Antipyrin..... xv. grains.
Boric acid..... ʒ ss.
Salicylate acid..... iv. grains.

This may be snuffed freely, as it causes no irritation of the alæ nasi as does the preceding.—*Jour. de Mèd. et Chir. Prat.*

TREATMENT OF ACUTE BRONCHITIS.

Simple cases usually recover (Dr. Canfield, *Therap. Gazette*) under the use of a good expectorant mixture, such as:

℞ Ammon. muriat..... ʒss
Mist. glycyrrhiz, co..... ʒiv. M.
Sig.—Dessertspoonful every three or four hours.

When the secretions are abundant, and not easily coughed up, a turpentine emulsion is excellent. For instance:

℞ Ol. terebinth..... ʒij to ʒiij.
Muc. acaciæ..... q. s.
Aq. cinnamon..... ʒi.
Aquæ, q. s. ad..... ʒvj. M.
Sig.—Tablespoonful in water every four hours.

Sometimes the cough is of such an irritating character that expectorant measures avail little. Some narcotic must then be used. Codeine has not the disadvantages of morphine, and is efficient. A good combination is:

℞ Codeine sulphat..... gr. viij.
Syr. prun. virgin..... ʒviij. M.
Sig.—Tablespoonful in water three or four times per day, and at bed-time if necessary.

TREATMENT OF BALDNESS.

One of the best combinations in the treatment of baldness consists of:

℞ Pilocarpinæ hydrochloratis..... gr. v.
Otto de rosæ..... m viij.
Olei rosmarini..... f ʒ iv.
Linimenti cantharidis..... f ʒ iv.
Glycerini puri..... f ʒ j.
Olei amygdalæ dulcis..... f ʒ ij.
Spiritus camphoræ..... f ʒ iij.
M. S.: To be rubbed well into the scalp, night and morning.

—Whitla, *Ther. Rev.*

Book Reviews.

Die Mikroorganismen der Mundhohle. Die ortlichen und allegemeinen Erkrankungen, welche durch dieselben hervargerufen werden. By W. D. Miller. Geo. Thieme, Leipzig, 1892. Second Edition, 440 pages, 134 figures and 18 photograms. 12 marks ($3.00).

The fact that this work ran through its first edition in two years time speaks very well both for the book itself and for the author, who is one of the few Americans called to fill professors' chairs in German universities.

The first part of the work contains a general discussion of bacteriology; the nourishment which bacteria find in the mouth; an historical review of bacteriology as applied to dentistry; methods of preparing cultures, etc.; fermentation caused by bacteria found in the mouth; influence of the fermentation upon different parts of the mouth; caries of the teeth, including both historical review and original investigations upon the same; and asepsis and antisepsis in dentistry. The second part of the book contains an excellent discussion of the pathogenic bacteria found in the mouth.

The entire work is excellently illustrated and will be of value to the practicing dentist as well as to the bacteriologist. We recommend this work to all our dental friends.

A Public Scandal. Inoculation a Preventative of Swine Plague with the Demonstration that the Administration of the Agricultural Department is a Public Scandal. An Exposure by F. S. Billings.

This pamphlet of over 300 pages consists chiefly of a review of Dr. Billings' charges against Dr. Salmon, Chief of the Bureau of Animal Industry, together with charges of treason against Secretary Rusk of the Department of Agriculture, and a personal estimate of his own (Billings) ability and the value of his scientific investigations.

We do not think Secretary Rusk will be tried for treason on account of the charges made against him by the writer, namely: That he (Secretary Rusk) has continued to doubt the value of Billings' methods and has allowed himself to be duped by Salmon. Nor do we believe that the eminent Chief of the Bureau is going to suffer any from attacks made in such manner and in such language.

Some of the statements made are too good to leave unmentioned.

On page 21, the Nebraska bacteriologist asks, referring to himself, "Is there a better man for this work to be found, not only in this country but in the world to-day? Virchow is my only master."

The chapters in which charges of treason are brought against Uncle Jerry Rusk and which discuss "The causes which have led to the conditions here portrayed in American politics" are amusing and in entire keeping with the rest of the book.

Dr. Billings' imagines that Secretary Rusk has spies placed around the Nebraska Laboratory; that the Department of Agriculture stands in great fear of his exposures and that he himself is a modern martyr. His entire book immediately suggests the idea that the author is in an excited, nervous and unhealthy state of mind.

BOOKS RECEIVED.

[In sending books for notice in the REPORTER, publishers are requested, for the information of the reader, as well as for their own advantage, to give the price. This announcement by title will be followed, in most cases, by a review, which will appear at the earliest opportunity.]

Annual Report Philadelphia Bureau of Health, 1891.

One Thousand Prescriptions or Favorite Formulæ of Various Authors, Teachers and Practicing Physicians. The whole being very carefully indexed and including most of the newer remedies. Price $1.00. Published by the Illustrated Medical Journal Co., Detroit, Mich.

Physician's Pocket Diary. For 1893. Any physician who has not received a copy of the McArthur Diary for 1893, will receive one on application, without expense. McArthur' Hypophosphite Co., Ansonia, Conn.

The Physicians Visiting-List, 1893. Lindsay & Blakiston's. Forty-second year of publication. Philadelphia: P. Blakiston, Son & Co. 1012 Walnut Street. Price $1.00.

NEWS AND MISCELLANY.

NATIONAL ASSOCIATION OF RAILWAY SURGEONS.

SIXTH ANNUAL MEETING.

Preliminary announcement of the special program of the sixth annual meeting of the National Association of Railway Surgeons, embracing the United States of America, the Dominion of Canada and the Republic of Mexico, to be held at Omaha, Neb., the last Wednesday, Thursday and Friday of May, 1893. General subject:—"Injuries of the Cord and its Envelopes Without Fracture of the Spine."

1st. History, by Dr. Geo. Ross, Chief Surgeon Richmond & Danville R. R., Richmond, Va.

2d. Anatomical Landmarks, by Dr. Jabez N. Jackson, Surgeon Wabash R. R., Kansas City, Mo.

3d. Physiology of the Spinal Cord, by Dr. A. P. Grinnell, Chief Surgeon Central Vermont R. R., Burlington, Vt.

4th. Experimental Research, by Dr. B. A. Watson, Surgeon Pennsylvania R. R., Jersey City, N. J.

5th. An Experimental Study of Spinal Myelitis and Menengitis, by Dr. Geo. A. Baxter, Div. Surg. Chattanooga Southern R. R., Chattanooga, Tenn.

6th. The Clinical Aspects of Spinal Localization, by Dr. Nicholas Senn, Surgeon Chicago, St. Paul & Kansas City R. R., Chicago, Ill.

7th. Diagnosis from the standpoint of the Neurologist, by Dr. C. H. Hughes, Consulting Surgeon Missouri Pacific R. R., St. Louis, Mo.

8th. Pathology and Pathological Anatomy, by Dr. Samuel C. Benedict, Surgeon Richmond & Danville R. R., Athens, Ga.

9th. Prognosis, by Dr. Samuel S. Thorn, Chief Surgeon, Toledo, St. Louis & Kansas City, R. R., Toledo, Ohio.

10th. Treatment, by Dr. W. B. Outten, Chief Surgeon Missouri Pacific R. R., St. Louis, Mo.

11th. Medico-Legal Aspects, by Judge J. H. Collins, Chief Counsel Balto. & Ohio R. R., West of the Ohio river, Columbus, Ohio.

12th. Statistics of the Amount of Money paid by the Railroads of the United States, During the last Ten Years, for Alleged Injuries of the Spine, by Dr. F. K. Ainsworth, Surgeon Southern Pacific R. R., Los Angeles, California.

13th. Clinical Report—1st, From a Medical Aspect—(a) Permanent Injuries—(b) Alleged Injuries. 2d, From a Legal Aspect—(a) Settled with Suit—(b) Settled Without Suit—(c) Miscellaneous, by Dr. Geo. Chaffee, Surgeon Long Island R. R., Brooklyn, N. Y.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . 1 gr. | Concentrated Pepsin 1 gr.
Ext. Nux Vomica ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

THE TREATMENT OF SELF-LIMITED DISEASE.

By CARL E. BLACK, M. D.
JACKSONVILLE, ILLINOIS.

In calling attention to the subject of the treatment of self-limited diseases it is not intended to advance any new theories of treatment, advocate the use of particular drugs or methods, or to make any extended report of cases. The object is rather to present in a questioning way, some of the problems which perplex young men in medicine, some of the questions which are constantly presenting themselves to young men for solution. It is hoped that by suggesting some of these problems, satisfactory and complete explanations will be given by those who are full of wisdom, and rich in the experience of many years. Young men feel privileged to ask questions, and to expect those older in experience to answer them.

There are many things which are calculated to bewilder the student of medicine, but they are multiplied ten-fold after he has been in practice a few years, and has become acquainted to some extent with the habits of treatment pursued by the practitioners with whom he comes in contact. And his bewilderment is in no wise diminished by consulting authorities, for these he finds contain equally conflicting views and dogmatical statements. The young man soon discovers that he can find authority, more or less good, for almost anything.

The special object of this paper is to call your attention to a brief consideration of some points in the treatment of acute self-limited diseases. That is those diseases which run a more or less definite course, and tend to recovery. Please bear in mind especially the last statement, "tend to recovery." Take as examples typhoid fever and pneumonia. These are as different as possible in the onset and in the course they pursue, and yet both have a more or less definite course, and both tend to recovery. A large number of such diseases could be mentioned, but those two will serve the purpose of illustration.

In every case of acute febrile disorder of a definite character we have general symptoms which are brought about by a systemic poison. The poison is generated in some seat of local inflammation, which is properly the seat of the disease. There is a sore with all the characteristics of an external local inflammation. In fact, in some diseases under this head, the seat of inflammation is external, or partially external, as in erysipelas, scarlet fever, etc.

The severity of each case depends on the extent of the inflammatory lesion, the amount of poison generated and absorbed into the system, and on the resisting powers of the individual.

The relative proportion of these three elements is infinitely varied in different cases. The systemic disturbance may be great from an apparently small lesion, or *vice versa*, the lesion may seem large and yet give rise to little systemic disturbance. The peculiarities of the individual and his surroundings have much to do with the severity of an attack of any acute disease.

It is a general proposition beyond dispute, that, by the time we are able to positively diagnosticate an acute disease of this class, it is too late to use any means to check it. To say that we have aborted a case of typhoid fever or pneumonia simply means that we have failed to make a diagnosis, and it would be far better to be honest enough to acknowledge that the typhoid fever or the pneumonia had not existed at all, and that we had simply been mistaken, instead of trying to hum-

bug the patient and his friends into believing that we had accomplished a great and wonderful thing.

When typhoid fever exists,—that is when the inflammatory process is begun in the intestinal glands and sufficient general symptoms have been produced to enable the physician to make a diagnosis,—the disease is there, and will run its course in a fairly definite way in spite of all abortive measures ever tried. When the lung is attacked with pneumonic process, and we have the signs and symptoms on which to base a diagnosis, the pneumonia is there to stay, and to run its course, and no amount of drugging will avoid it. It is absurd to say that a patient would have had pneumonia if certain large doses of quinine has not been administered promptly. How can pneumonia or typhoid fever be predicted before it has arrived? It is difficult to imagine that when typhoid fever or pneumonia is sufficiently fixed in the human economy to enable the physician to make a diagnosis that it can be shaken out by a few doses of quinine or other medicament.

Even before the question of diagnosis is settled there comes an important consideration. That is, not to mask the diagnosis by instituting vigorous treatment too soon. It is not probable that vigorous measures of treatment will be demanded before the diagnosis is fully settled. Frequently cases are treated for malarial fever with large doses of quinine until, much to his embarrassment, the physician is forced to change his diagnosis to typhoid fever just in time to have the certificate of death properly filled out. Added to the probability that if the administration of the quinine had been postponed a little the diagnosis would have been made early, is an equally strong probability that if the quinine had not been given at all the patient's chances for life would have been materially improved. If the teaching of works on Therapeutics are worth anything, it certainly gives quinine little more place in the treatment of typhoid fever than morphine would have in the treatment of opium narcosis.

Quinine acts strongly on the nervous system, and by its use all the nervous symptoms are intensified. When we hear a doctor say that he has made a diagnosis of typhoid fever by "carefully elimating the malarial element by the use of quinine," we can predict with reasonable certainty that his typhoid case will be one with intensified nervous symptoms. A very common error in diagnosis is to fail to differentiate malaria from typhoid fever. It should be rare that a case of typhoid fever is diagnosticated as malarial fever. Malaria should not be used as the shield for our mistakes. The risk to our patients is too great. It is far better to say the disease is not sufficiently developed to make a diagnosis. Above all do not try to force a diagnosis by the use of quinine, for we will certainly do harm if the case proves to be one of typhoid fever.

Let us look for a moment at the general characteristics of acute self-limited diseases. In the first place, we have a person previously healthy, stricken down by an acute onset of disease, having been preceeded by premonitory symptoms more or less pronounced. Then follow all the symptoms of an inflammation. These diseases are variously named according to the seat of inflammation. There is fever as a constant factor in all. The tendency of all is to run a definite course and to end in recovery. There is an inflammatory lesion of which the producing cause is the same in every case of the same disease. Modern researches would lead us to believe that every disease of this class has a specific organic cause, and further, this causative agent is *similar* in all these diseases.

We should always bear in mind that a fatal result follows in only a small per cent. of cases, and always from one of two causes—either there is some complicating element in the case, or there is such an intensity of the poison from the first that a fatal result is almost inevitable. The toxic principle is forced into the system in such quantities that all the vital functions are overwhelmed and overcome in spite of all efforts to assist in eliminating the poison and to sustain the patient. This is peculiarly true of pneumonia. Frequently cases are seen in which the lungs fill up so rapidly, and the general disturbance is so great, that the patient is carried away by the intensity of the disease process.

The fatal cases of typhoid fever are more frequently the complicated ones; but still all have seen cases, which, from the beginning, seemed almost certain to terminate fatally on account of the intensity of the process.

In considering the treatment of these cases the first thing which engages our attention is the question of specifics. Do we possess any specifics for any or all of these diseases? Almost every drug in the pharmacopœia has been accredited with some specific action in one or more acute diseases. But still we will be tolerably safe in saying there are no specifics for these diseases, and in the very nature of things it seems almost impossible that there should be. The proof that several of these conditions are of germ origin, and the inference that all the others have similar causative agents, has given a clue to the group of remedies among which to search for specifics.

After the germs of typhoid fever have been implanted in a patient and have developed sufficient activity to enable us to make a diagnosis, it is probably too late to apply specifics. The use of salicylic acid in rheumatism and mercury in syphilis probably approach more nearly specific remedies than any we know, and yet there is much doubt whether they really cut short an acute attack of rheumatic fever or syphilis when these are once well established. Still the acute symptoms of rheumatism often seem markedly modified by the salicylic treatment. Of course, the specific action of quinine in malaria is beyond dispute.

Thus it seem tolerably well settled that, with very few exceptions, it is beyond the power of the physician's art to cure diseases. The doctors of past generations cured diseases. To-day it is a question whether it is within the reach of the healing art to *cure*, except in comparatively few instances. Even in so simple a thing as opening an abscess we only do that which nature was trying to accomplish, and thus, by assisting the natural process, hasten the reparative process. The broadest usefulness of the physician is found in watching closely the efforts of nature, studying the methods by which she is trying to effect a cure, and rendering such assistance as will be useful. Above all, we should be absolutely sure that we do not *interfere* with nature's plan and retard it, thus doing harm.

It would seem that the general and promiscuous use of antipyretics and remedies which have marked depressant effect on the circulation must be harmful, and retard and endanger the final favorable conclusion of acute disorders. The general use of veratrum, aconite, and the coal-tar derivatives in pneumonia illustrates this thought. The thing most to be feared in this affection is a sudden failure of the heart's action. The best authorities agree that veratrum acts by its power to paralyze the heart muscle and the vaso-motor system of nerves—that it is a cardiac poison and also a respiratory poison. The use of veratrum in pneumonia would not seem desirable as a routine practice, however valuable it may be in the onset of certain selected cases.

That there is a very large amount of useless medication in vogue in the treatment of these diseases, seems evident; and that some plans of treatment are actually harmful is more than a possibility. Of course experimentation in the effects of therapeutic agents is necessary to the advancement of medical science, but such experimentation should be coupled with accurate observation. Empiricism should not be confused with experiment. Our first consideration should be for the welfare of the individual patient. Since, when our case is once established, we cannot abort it and have no specific agents with which to combat it, our first object should be to look well to all the general conditions of the patient and his surroundings. Such considerations as the bath, spongings, diet, hygienic measures, climatic influences and the like should be thought of first. Put the patient in the most favorable condition to resist the disease. The public must be educated to expect more wholesome advice and less useless drugging. Let us remember that much of the medication in vogue is a matter of fashion, and changes almost as rapidly as the seasons. The truly scientific advances in medicine never change, because they are founded on truth and not on theory.

Where is the dreaded plague which once devastated vast populations? Science has stamped it out with its agent—hygiene. How is it that cholera and yellow fever do not spread like the prairie fire and destroy thousands of our inhabitants as they used to do? Science has fenced them in with its agency—quarantine. How is it that cases of small-pox appear but do not spread their contagion to our communities? Science has placed its shield, vaccination, about us. What has become of puerperal fever, with all its dangers to life and home and happiness? Science has sent its agent, asepsis, to prevent it, but if it

should appear, has given us the agent, antisepsis, with which to control it and stamp it out.

These are a few of the posts which stand out prominently to mark the real progress of the last few years in the management of disease. These advances have nothing to do with the giving of drugs, but are infinitely more important. Not that we think for a moment of abandoning the use of drugs, but they should not be considered *all-important*. Do not despise such advice as fresh air, good light, clean linen, the bath, quiet rest in bed, comfortable, quiet surroundings, nutritious but appropriate diet, and attention to the excretions and secretions. It will be the exceptional case of an acute, self-limited disease which will really demand the administration of drugs when all the general conditions are fully attended to. We know that when the disease is established there is little in our art that will affect it directly, except as we observe what nature is trying to accomplish, and render assistance or remove obstacles which lie directly in the line of her efforts. Certain symptoms may be modified and the strength of the patient conserved by well-chosen measures which will assist nature in her efforts.

The largest field of usefulness in the future is to be found in warding off disease by sanitary protective measures and by securing individual immunity. It is hoped that the discussion of this subject will bring out more in detail the usefulness and uselessness of the measures and agents in popular use in this class of disease.

We have few remedies which are definitely shown to be useful in acute self-limited disorders, and there is little general agreement among authorities as to what measures will be found beneficial. One author recommends an agent, another author of equal standing condemns it. Much of the present treatment is empirical, and not founded on any reasonable physiological or even experimental basis. While we are trying to find remedies which will do good, we must remember to be sure and do our patient no harm. Recognize the power of nature and assist her, for, if her efforts are seconded judiciously, she will allow few to die.

The following quotation from a well known authority (Herrmann Nothnagel, of Vienna, *Popular Science Monthly*, May, 1892,) is full of meaning:

"Although the expectation and the possibility of controlling the fundamentals of pathological processes are so limited, the healing art is nevertheless not doomed to vain contemplation and inactive dallying. While art cannot master nature, it can follow it with diligent observations. The truth of this remark covers a genuine progress and furnishes the key of the success of really great physicians. To investigate the exact origin of pathological changes; to ascertain by what method and under what conditions disturbances of the organism are most easily overcome and counterbalanced; deliberately to support and imitate these methods if possible; and, before all. do no harm, is the way by which the healing art can accomplish something important and good. History proves incontestably that practical efficiency at the sick bed goes in an exactly parallel line with the cultivation of scientific methods. Medicine to-day, without yet being able directly to cure the pathological condition, reaches, simply by following the principles here laid down, incomparably more favorable results than formerly. It has learned, first of all, not to interfere so as to destroy the course of natural compensations, but seeks by dietetical, hygienic and climatic influences here, by the removal of excitants there, by methodical stimulations of the matter-changes of the nervous system, to put the organism into a condition to overcome the pathological disturbances. To use such measures, carefully adapted on principles of scientific observation and enlarged knowledge of the course of disease to the most diverse conditions, continually to furnish a closer support to the natural compensations and adaptations, that is one of the ways in which the healing art must turn in order to enlarge its scope."

MODERN TREATMENT OF EMPYEMA.

By D. A. K. STEELE, M. D.,
CHICAGO, ILLINOIS.

PROFESSOR OF PRINCIPLES AND PRACTICE OF SURGERY AND CLINICAL SURGERY IN THE COLLEGE OF PHYSICIANS AND SURGEONS, CHICAGO.

The great increase in the number of cases of empyema during the past year or two, is a sufficient reason for considering the best methods of dealing with this surgical affection.

The greater frequency of pleural abscesses is probably due to the saturation of the blood with bacterial germs of recurring epidemics of influenza.

By empyema we mean a collection of pus in the pleural cavity; bounded on one side by the soft, receding, compressible lung, and on the other by the firm, unyielding, bony chest-wall.

In the consideration of its surgical treatment we follow the lines laid down by Immerman, of Basle:

First, to evacuate the pus.

Second, to prevent the formation of more purulent matter.

Third, to restore the respiratory apparatus to its normal condition.

To accomplish these three objects a great variety of surgical procedures have been devised. In a paper presented to the surgical section of the thirty-ninth annual meeting of the American Medical Association, held in Cincinnati, May 10, 1888, I classified the choice of operations as follows:

First, aspiration.

Second, aspiration and washing out of the cavity with an antiseptic solution.

Third, thoracentesis with trocar and canula.

Fourth, thoracentesis with subsequent drainage.

Fifth, simple incision.

Sixth, simple incision and drainage.

Seventh, simple incision, with through and through drainage, with or without antiseptic precautions.

Eighth, subperiosteal resections of rib and drainage.

Ninth, thoracoplasty—Eslander's operation.

Tenth, perflation.

Greater experience with these different methods enables me to say that aspiration for diagnostic purposes and to afford temporary relief to the patient, followed by simple incision and drainage with antiseptic irrigation and the application of an antiseptic dressing, constitutes the modern method of treatment of empyema. In some cases where the ribs are too close together to afford room for the drainage tube, or where its presence produces neuralgia from pressure upon the intercostal nerves, the subperiosteal resection of a rib must be resorted to, although it is seldom that I have found this procedure necessary.

In regard to the technique of the operation I would say, that the simplest, speediest and safest plan of operation is the best. The one that subjects the patient to the least additional risk of shock, pain, or time of operation should be selected.

Time of operation.—The operation should be done at the earliest possible moment after a diagnosis of a collection of pus in the pleura has been made; nothing is gained by delay and much valuable time is lost. The strength and vitality of the patient are jeopardized.

Anæsthetic.—Local anæsthesia by hypodermic injection of a five or ten per cent. solution of muriate of cocaine, or by freezing the site of operation with an ether spray, is greatly preferable to the use of a general anæsthetic, especially where there is a large collection of pus, or where the heart has been displaced.

Site of Incision.—The incision should be made in a location that will most perfectly drain the pleural cavity, whether the patient is lying or sitting.

These requirements are best met by an opening in the vertical line below the posterior fold of the axilla, between the sixth and seventh ribs on the right side, and between the seventh and eighth ribs on the left side. Of course, various modifications of the site of the incision are required for special cases.

Two plans of making the incision are open to us: either to pinch up a fold of the skin with thumb and finger at the point indicated and transfix it with a sharp-pointed bistoury, thus leaving an incision of two inches in length down upon the intercostal muscles, which are quickly separated by dissecting forceps and the bulging pleura punctured with sharp-pointed scissors or director, along which the drainage tube, grasped by a pair of forceps, is pushed into the abscess cavity; or you may push the index finger of the left hand down between the ribs at the point selected, and alongside of it introduce a grooved exploring needle, and along the groove of the exploring needle push a narrow, blunt-pointed bistoury and make a two-inch incision midway between the ribs through the entire thickness of the chest-wall, and introduce your drainage tube. I prefer the first method, although both are done very quickly and safely.

A double tube should always be introduced, so that you can throw a stream in one tube and have the return current flow out of the other. The tube should not exceed one-third or one-half inch in diameter, and only the return tube should have lateral perforations. There should be a free opening at the inner extremity of the tube. This is easily obtained by bending the tube upon itself and cutting off half the thickness of one side of the bent fube. An ordinary safety-pin holds them well in position.

Andrew's tube is too large for the majority of cases. Hancock has recently fused two tubes together and fitted over them a rubber plate or collar which is a decided advantage.

After thorough irrigation with a warm antiseptic solution until the water returns clear, the wound around tubes is covered with iodoform gauze and a moist dressing of bichloride gauze ten or twelve thicknesses surrounded with salicylated cotton, is applied and kept in place with a flannel roller. The dressings should be changed and the cavity irrigated daily for the first week, and thence every other day.

The strength of the solution may be bichloride of mercury 1 to 8,000 or carbolic acid one per cent., or Labarraque's solution, one to twenty, which latter is the safest.

The temperature of the water should be 100° to 105° and the quantity for each irrigation should be at least two gallons.

The time of treatment required under this plan is from two to six weeks.

It is not necessary to wait until the cavity is completely obliterated before the tube can be removed, but when for several days there has been an absence of pus, and the discharge consists of a small quantity of colorless, odorless serum, the tube may be removed after a thorough irrigation, and the cavity sealed up. It is possible to disinfect and sterilize an old septic cavity where old adhesions prevent its obliteration by approximation of the lung and chest-wall, and then seal up a clean cavity of large size and have no further trouble from it.

I believe in the majority of cases tubes are left in too long and irrigation continued too persistently, and that it is possible for us to materially shorten the duration of treatment of empyema cases.

SOME SUGGESTIONS ON INGUINAL HERNIA.

By W. M. HARSHA, M. D.,
Chicago.

Considering the prevalence of inguinal hernia, the frequnecy with which strangulation occurs and the dangers that attend it, we may well be surprised at the want of interest manifested by the profession generally in its prevention and treatment.

Among the most potent predisposing causes are hereditary muscular defects and lengthened mesentery. With these, little can be done in the way of prophylaxis.

Among the most frequent exciting causes, especially in the young, where most cases occur, are constipation and phimosis. These are conditions that may be remedied. Strict instructions to nurses in regard to the management of infants may prevent many cases of hernia. The practice of giving soothing syrup or other opiates often induces a constipation that may cause a hernia. The use of castor oil may be followed by a secondary constipation. A small enema is often all that is needed to move the bowels, and the mildest means which will suffice are to be urged, especially in families predisposed to rupture. The neglect of a phimosis has been a frequent cause of hernia, as is well known. The treatment of the phimosis is demanded from other considerations as well. The longer the conscientious physician practices his profession the more he feels the responsibility of his position; and the neglect of anything that may cause a hernia may prove a disagreeable memory to the physician as well as a source of mortification and danger to the patient.

After the hernia has occurred we have a foe worthy of our steel and we should not send the case to a truss-man at random. There are conscientious and skillful instrument-makers who try in a rational and intelligent manner to treat each case on its merits, but the majority of these men have a favorite truss or appliance, as they may be pleased to term it, with which they profess to treat all cases successfully.

Directions given in text-books are often vague and leave much to the judgment of the surgeon. In congenital cases not

infrequently the management of an undescended testicle is involved in the treatment, where a nice adjustment of a small pad may be a necessity. Again, we may have a case of long standing where the rings are approximated and present the appearance of an opening straight into the abdomen directly above the pubic bone. In such cases a hard pad with the pressure in the right place will injure the cord, while over the usual site of the internal ring it is wide of the mark. Such a case I have found best-managed by means of a soft rubber pad filled with water, which may press close to the pubic bone, retaining the hernia, but sparing the cord. It is my belief that a majority of cases in children may be cured in a reasonable time by properly selected and adjusted trusses, if the same care and attention be given to them that other surgical cases no more important command. Our duty is not done when a truss is adjusted. We should keep the case under observation and note the progress, or lack of it the same, as we would in a case of spondylitis.

Operations of a radical character are not often to be recommended in the young except when strangulation occurs. The different character of the sac in many cases of congenital hernia and the lack of intelligent co-operation on the part of the patients contra-indicate operation as a rule. However, where the rupture is not retained by a truss and where conditions tend to grow worse, I think it our duty to treat them by operation.

My experience with the injection method in children does not encourage me in its use. In some cases, both of children and adults, I have used it successfully, especially where the opening has been small, the hernia reducible and the canal not obliterated by long distension. I have used the injection as recommended by Warren, of Boston, the fluid composed mainly of a concentrated fluid extract of white oak-bark. The injection method has, however, been well characterized as blind surgery, and can be recommended in but a limited number of cases.

Since aseptic surgery has come to us, open operations are comparatively safe when done in the absence of strangulation, and we believe will become more frequent in both children and adults. Considering the very high death rate from strangulations and operation for relief, it seems strange that operations should be so rare in the absence of strangulation, or so late when it is present.

There are many cases of hernia, that are not well retained by trusses, that are painful and constitute a constant source of danger, in which operation should be advised.

In the conduct of the operation the first requirement is absolute asepsis so far as that is possible.

If there has been much distension of the skin and subcutaneous fascia, enough of the redundancy should be removed to secure a smooth and somewhat tense covering. The incision recommended by Dallas, of New York, commends itself to me. It is begun above the pubic bone and carried straight outward beyond the canal, then straight upward. The triangular flap is then dissected up and reflected, exposing the field of operation. Incision is now made along the direction of the canal through the deeper structures down to the sac in the usual manner.

The sac is next treated according to the individual preference of the surgeon, but should be cut off close up to the internal ring, or treated in such a manner as to prevent any protrusion or pouching.

Buried animal sutures should be used as recommended by Marcy, of Boston, throughout the extent of the wound along the canal, in order to get the most firm union. The flap of skin and fascia may now be stitched in place, preferably, I think, by silkworn gut, tied as advised by Treves, i. e., using only the first part of the ordinary surgeon's knot and left lying flat on the surface. If much tissue has been resected a tension suture may be used.

The edges being easily approximated, may be painted over with flexible collodion, saturated with iodoform, and an antiseptic dressing placed over the whole. Union by first intention, may be expected throughout, and if it is thought best to wear a truss afterward, it can be adjusted so as not to be directly over the cicatrix as in the ordinary operation. In a majority of cases I believe a truss, with only moderate pressure, should be worn for a time, as I think the danger of pressure atrophy very slight. The frequency of ventral herniæ after laparotomies shows the necessity for precaution in any operation involving the abdominal wall.

In calling attention to this subject I wish to emphasize the following points:

1. That hernia in children may frequently be prevented by strict instructions to the nurse, or by operating to cure a phimosis.

2. That hernia having occurred, a persistent effort should be made to effect a cure by means of suitably adjusted trusses while the child is in the growing stage.

3. That failing to effect a cure in that way in due time, and especially failing to retain the hernia, an operation should be advised—usually the open method.

4. That in adults where retention is difficult and uncertain, and the patient made uncomfortable or disabled, an operation should be advised in the absence of strangulation, and an early operation in case of strangulation.

5. That after operations it is better to wear a truss or some sort of support until adhesions are firm.

THE TREATMENT OF TUBERCULAR PERITONITIS.*

By WILLIAM H. MYERS, M. D.,
FORT WAYNE, IND.

"My Uncle Toby" considered that the secret of human happiness lay in the possession of a soul-satisfying hobby. If his idea was correct, then it has been our good fortune to be happy since 1821, at which period Drs. Graves and Stokes, of Dublin, first directed attention to the use of opium in the treatment of peritonitis. Afterwards under the teachings of Dr. Clark it assumed considerable permanence and predominated over all other treatment and was regarded as curative. This period constituted the opium habit of the profession. At present we have a progressive invasion by the surgeon of this once purely medical region. Inertia in the profession is passing away. Professors and authors are no longer followed by us, with a punctuality equaled only by the old order of monks, about penance and absolution. We are just now emerging from the doctrines of the living ancients, that opium, alcohol and liquid diet is the treatment for peritonitis, whatever its cause, and whether it be general, circumscribed, diffused, septicæmic or tubercular. If there be those present who endorse this treatment under all conditions then I can only say, "God hath not justly dealt by them," for a correct diagonsis with a correct apprehension of the etiology of each case must suggest a different line of treatment from that mentioned. We assert that it is only through a perfect diagnosis that we can see when and how therapeutical or surgical measures must be attempted. Upon this all correct treatment must depend. It is also of primary importance that the etiology be definitely settled at the earliest moment. "We must learn the beginnings of disease" as remarked by Sir Wm. Gull: "Often when the gathered clouds of the final storm have filled the atmosphere, it is in vain that we look around to see from what part of the heavens it began." When we have arrived at the conclusion that peritonitis is present, and have discovered the cause, the blow must be struck simultaneously with the onset. No delay can safely be tolerated, the only hope of rescue being the sudden arrest of the disease, for in the language of Hutchinson, "it is almost impossible to exaggerate our conception of wild-fire rapidity with which inflammaion of the serous membranes may extend when once an adequate cause has been supplied. By the time that the normal outlines of the abdomen are obscured by tympanitic distension, respiration quickened and shallow, the pulse rapid and wiry, the supreme moment for precise diagnosis is passed"

I need hardly remind you that the greatest advancement made in the surgical treatment of disease, was the result of investigation by abdominal surgeons into the tolerance of the peritoneum; this led to new lines of research and from them have resulted a complete revolution in peritoneal surgery. They soon discovered that idiopathic peritonitis was only found in the text-books and not in the abdomen. Passing from this to the subject of our paper, we may quote the language of Dr. Osler, that "abdominal section for tubercular peritonitis is the most recent triumph of surgery." At the last meeting of the American Obstetricians and Gynecologists, I reported two cases of tubercular peritonitis treated by abdominal section, washing out the abdominal cavity and drainage,

*Read before the Southern Surgical and Gynecological Association, Nov. 15–17, 1892.

with complete recovery. Since then I have operated upon another case, apparently with a like result. All these cases were males, with ages ranging from twelve to twenty years. In the last case adhesions were extensive, between the bowels, accompanied by tubercular deposits, and a strong band of lymph thrown across the colon in the right iliac fossa, causing obstruction and was believed to be a case of typhlitis. The diagnosis was only made clear by the laparotomy; there was present only a moderate amount of fluid. The enlargement of the abdomen was due to numerous deposits in the mesentery. The body was emaciated. This case evidently belonged to the adhesive form of the disease, and this accounts for the irregular and impeded peristalsis or intermittent obstruction of the bowels, it being the most prominent symptom.

The chief interest in these three cases is the bearing they have upon the treatment of chronic tubercular peritonitis. Let us contrast the result of surgical treatment with medical treatment. Under the latter the prognosis had been so grave as to preclude the possibility of holding out to the patient the least hope of recovery. Loomis, one of Clark's disciples, says: "The treatment of tubercular peritonitis demands small doses of opium, warm anodyne applications, tonics and cod-liver oil." His prognosis he states as follows: "Tubercular peritonitis after weeks and months of anæmia and exhaustion, terminates in death." Davis under the subject chronic peritonitis, says that "all cases arising from tuberculosis are incurable, temporary relief may be obtained by removal of the accumulated fluid by aspiration or tapping, but the diseases which have given rise to the peritoneal trouble being themselves incurable, there is an inevitable tendency to a fatal termination." Bauer, in Ziemssen's Cyclopedia, regards the prognosis as absolutely fatal; the same opinion is expressed in Pepper's System of Medicine, and Fagg speaks gloomily of the issue. So if we trust medical writings on the subject, recovery from this disease must be considered rare and exceptional.

Curability by Operative Treatment — Kœnig, of Göttingen, gives an opinion founded on 131 cases, that by laparotomy 95 per cent. are much benefited and 25 per cent. completely cured. Manoange supplies us with 68 cases, of whom 13 died soon after operation, 15 disappeared, 14 remained alive at the end of six months and 26 at the end of twelve months. Homans records two cases with recovery. Goodell has operated on four cases; three recovered and one died in six months after the operation. Mundé has operated in three cases with one death and two recoveries. Kelly gives four cases and four recoveries. Imbach mentions five cases on which he had operated, with four recoveries. Grieg Smith has operated on two cases with one death. Pitts has operated on three cases and all made good recoveries. In a report of 112 cases the results may be stated as follows: One was unrelieved, 26 apparently recovered; 28 died soon after the operation, 57 made a more or less complete recovery—nearly 50 per cent.

In support of this new departure, I present the following quotation from a recent author: "Though it seems that the surgical claims are extravagant, I nevertheless, believe that in the routine treatment of tubercular peritonitis, recourse should be had to surgical means, both more frequently and at an earlier period than is commonly the case." Hare, in his recent work, speaking of two opposing factions in the profession, the one addicted to salines and the other to opium, claims the first-class dogmatically assert that the physician should turn over every case of peritonitis to the surgeon, to be opened, searched and purged, and he further asserts that too many cases of peritonitis are to-day walking examples of the value of the use of opium to permit anyone to assert that this treatment is useless.

In reply to this argument, I need only say that "walking examples" are referred to every day to attract the credulous, to crowd the consulting rooms of charlatans, who trade upon the discoveries of science to palm off their monumental proofs of success.

Diagnosis.—Called to a case, upon what symptoms, objective or subjective, can we rely as authorizing an abdominal section? The presence of tubercular peritonitis may be inferred if pain in the abdomen resembling colic and tenderness often recur with diarrhœa and febrile excitement present only temporarily; subsidence of these symptoms and the patient relieved, and in a few days again recurring, possibly in an aggravated form, and accompanied by a

mass detected in the umbilical, hypogastric, or iliac regions; the body wasting at the same time, while the abdomen remains large, often tympanitic, and with less of its suppleness; there may be detected serum or lymph and the difficulty of promoting absorption by the usual remedies, may be considered. In this discussion we have limited tubercular peritonitis to those cases in which the peritoneal affection predominates,—essentially an outbreak of gray miliary tubercles upon the peritoneum, from which inflammation of this membrane ensues. The disease presents itself in one uniform process, but with different stages; the ascitic, the suppurative and the adhesive. The first is the earliest stage; its product is serum. In the second stage we have pus, the product of the inflammatory action. In the third, adhesions due to the presence of lymph thrown out, the bowels agglutinated thereby and obstruction resulting therefrom. Now, gentlemen, the treatment must suggest itself to you. In the ascitic form to remove the fluid; this is essential to recovery; here the trocar and aspirator as curative procedures are abandoned and relegated. I would strongly impress upon you the free use of the knife. This has happily been substituted with the highly satisfactory results already referred to. In the second variety—suppurative—we know of no reason why the same general principles of treatment by surgical interference—the early evacuation of pus—should not be carried out. In the adhesive form, as its name implies, adhesions will be found between the intestines and possibly the parietal peritoneum; here obstruction of the bowels, often incomplete, accompanied by distension is often present. These cases are often latent and the pathological lesion is only revealed by an operation. The operation needs no especial description, only the suggestion of extreme caution, to open the abdomen freely, and to remove fluid lymph and caseous material as completely as possible, and not to depend merely upon the withdrawal of the fluid, the ancient method which is here considered "more honored in the breach than in the observance thereof." I would further advise the avoidance of germicidal solutions, to use hot water instead, to use drainage, and that the after dressing and after treatment be managed in the usual manner.

Communications.

RUPTURE OF THE STOMACH.*

By JOHN W. GROFF, M. D.,
HARLEYSVILLE, PA.

Traumatic rupture of the stomach without injury of adjacent organs is, I presume, a rare occurrence. Such a lesion, verified post-mortem, leads me to present the following case to this society.

A farmer, F. B., Aet. 50; a German, residing in this country but a few years; married; above the average in height; of strong muscular development; temperate, industrious and exceedingly frugal in his habits. On the day of the accident, immediately after breakfast and while gearing his horse, he was kicked by the animal, receiving the full force of the blow directly over the region of the stomach. He was able to reach the house, a distance of perhaps 150 yards, where I saw him an hour and a-half after the accident. I found him in bed, lying upon his right side with his extremities drawn up, and in the utmost agony. Occasionally he would vomit but the material was ejected without any force. There was no external evidence of injury visible save a few drops of blood in the umbilical fossa.

Shock was profound, and the pulse at the wrist was barely perceptible. Upon making a hasty examination I concluded he was mortally injured, and beyond the reach of human endeavor. Hence, the only object to be aimed at was the production of euthanasia. A prognosis was given accordingly and our efforts directed to making him as comfortable as possible. I gave him at once a hypodermatic injection of morphia $\frac{1}{2}$ gr., atropia $\frac{1}{100}$ gr. In half an-hour gave a second injection of $\frac{1}{4}$ gr. of morphia, followed in thirty minutes by a third injection of $\frac{1}{4}$ gr. of morphia. These were followed by a fourth injection at the end of another half-hour, when he became comparatively quiet and the vomiting ceased. The pain was not completely relieved at any time.

Dry heat was applied to the extremities and I left him to return in about five hours. During this interval reaction had occurred and the mortal nature of the injury was still more evident. He lin-

*Read before Montgomery County Medical Society, November 2, 1892.

gered, however, and died sixteen hours after receiving the injury.

Autopsy by Dr. H. F. Slifer sixteen hours after death. Upon opening the abdomen the contents of the stomach were found free in the cavity. Careful examination of the whole length of the intestine showed no injury whatever. He found in the stomach a large irregular opening, about two inches in length, transverse to the lesser curvature, more on the anterior surface and nearer to the pylorus. All the coats of the stomach were divided completely excepting a few thin meshes of the serous coat still remaining over the wound. The omentum was deeply congested, as were the neighboring parts. There was considerable serous effusion in the abdominal cavity, also an increased amount of fluid in the pleural sac and in the pericardium. No free arterial blood had been noticed in the vomited matters. There were evidences of old pleurisy, but no other organs showed noticeable evidence of pathological change.

[This report, necessarily condensed, is of interest on account of the character of the injury and the method of treatment pursued. Possibly a different result would have followed more active measures.

The condition of the patient—shock, pain, *forceless* vomiting, history of the accident, etc., seems to point definitely to the location of the injury and to suggest, at least, one of the organs involved. *Ante-mortem* section of the abdomen would have confirmed the diagnosis and perhaps, avoided this performance *post-mortem*. It certainly would not have hastened it. Repair of the opening, in the stomach, flushing the abdominal cavity with hot water and closure of the abdominal incision, with provisions for drainage, if they did not prevent the final result would have been more productive of *euthanasia*. The probability of a satisfactory outcome is indicated by the fact that, in spite of the injury and the treatment, the patient lingered sixteen hours. —Ed.]

Society Reports.

THE LOUISVILLE MEDICO-CHIRURGICAL SOCIETY.

Stated Meeting of November 4, 1892.

The President, Dr. F. C. Simpson, in the chair.

OBSTRUCTION NEAR INNOMINATE VEIN.

Dr. C. W. Kelly: Doubtless many of you have seen this patient, Thomas Welsh. He has been in the City Hospital during the past year. He was first in the Surgical Ward under the care of Drs. Yandell and Rodman. After examination he was sent to the Medical Ward and came under my care. I examined him and found obstruction to the flow of blood through the superior vena cava, the obstruction being located near the vena innominata, the heart being free from disease; the veins in the neck, face and arms were much distended and on the least exertion the face and arms would turn purplish black. I lost sight of this man three months ago, at which time, upon making an examination, I found the veins on the side of the trunk very large, the long thoracic and deep epigastric veins being fully the size of the index finger, the right being larger than the left. It was found that the current of blood was flowing from the head, neck, arms and trunk through these channels down to the inferior vena cava by the iliac veins; this could be very easily proven. A case like this I have never seen before. This man received an injury about a year ago, caused by the fall of a telegraph pole upon his head. However, I see no connection between the injury and his present trouble. He has suffered from an attack of pleurisy, affecting the left side. I suspect the obstruction has resulted from an inflammation, either of pleura or of tissues near the superior vena cava.

DISCUSSION.

Dr. W. L. Rodman: I would say that when this man came to the Hospital, a year ago last September, he was sent into the Surgical Ward. I was visiting surgeon at the time. After making a very careful examination, and from the history of the case I reached the conclusion that the blow on the head could not have had anything to do with the trouble, and referred him to the Medical Ward.

Dr. F. C. Wilson: The practical question is, what can be done, or whether anything can be done for him. The case seems to be progressing; I recollect seeing the patient over a year ago, and there has been considerable increase in the distressing symptoms since that time. The trouble seems to be gradually increasing, and I would like to inquire what has been done, and what the prospect is for doing anything for him. If the trouble is due to some inflammatory deposit an effort should be made to absorb this. Possibly iodide of potassium or bichloride of mercury would be of benefit, as these agents are known to produce good effects upon inflammatory exudates. I do not know whether any methods of this kind have been tried or not.

Dr. C. W. Kelly: Concerning the suggestion made by Dr. Wilson: This man was given iodide of potassium and the mercurial agents in large doses continued for six months, without any apparent benefit. I think nature is doing more for him than anything else could possibly do. His only hope of long life evidently is through the enlargement of these channels that are being opened up.

STRICTURE OF ŒSOPHAGUS—PATHOLOGICAL SPECIMENS.

Dr. W. L. Rodman: This specimen is the stomach and œsophagus removed from a man at the post-mortem examination. The history of the case is about as follows: German, forty-seven years of age; I found him in the Surgical Ward at the City Hospital when I went on duty about two months ago. He gave an uncertain history of syphilis to some of the physicians, but from what he told me I think he had an attack of gonorrhœa; he said he had a discharge from the urethra some ten or fifteen years ago. For eight months prior to the time I saw him, he had marked symptoms of stricture of the œsophagus. His œsophagus was carefully examined and the stricture located just below the thyroid cartilage. At the time I saw him he was unable to swallow even a drop of water; he had taken no food for two or three weeks; he was suffering the pangs of hunger; was going down hill all the time, and we commenced giving him enemata of milk and brandy. He improved very much for two or three weeks, really gaining a little flesh, and said that the enemata we gave him daily relieved his hunger and he was made far more comfortable by them. As he was doing so well, we thought we would hold him until we moved into the new Hospital. Then we intended to do a gastrostomy. As I said he was improving on the rectal feeding, and for two or three weeks gained flesh, he was able to be out of bed and worked around the Hospital. I was very much surprised to find, on going to the Hospital one Monday morning, that the man was dead. I was told by the *interne* that the patient had developed diarrhœa on Saturday, the bowel refusing to retain the enemata any longer, and died on Monday morning before my visit.

This is a very interesting case: The stricture is so complete that you cannot get anything through it at all. I saw the man make four or five attempts to swallow some water, not a drop of which passed the stricture, judging from the amount that returned. The stricture is just about where I thought it was, a couple of inches below the thyroid cartilage. When I saw him he said the first symptom he had of stricture was eight months previous to that time; now the stricture was complete. The man had taken large doses of mercury and iodide of potassium which did no good.

I suppose it must be stricture as a result of traumatism. I do not think it was the result of a neoplasm, although this was my opinion at the time. It does not look like an epithelioma; there is no apparent history of traumatism; no history of his having swallowed caustic of any kind. I believe now that it resulted from simple ulceration, the result of trauma.

DISCUSSION.

Dr. A. M. Cartledge: It strikes me as being a remarkable stricture of the œsophagus; it does not present the appearance of a malignant or syphilitic stricture which we usually find; I say this from the simple appearance, although the stricture is a very severe one and is probably due to trauma originally; due to something he swallowed, causing ulceration and a resulting cicatrix.

Dr. Wm. Cheatham: I saw this patient during my term of service at the hospital, and never saw a man improve so

much under rectal feeding. I tried both the bougie and œsophagoscope and each marked different depths of the stricture. I have used the œsophagoscope on several cases of stricture very successfully. I had a case a few days ago complaining of stricture three or four inches down, which the œsophagoscope showed to be spasmodic in character. This instrument can also be used to good advantage on growths in the œsophagus. The only objectionable feature is that the patient has to be cholo-formed and put in an exaggerated tracheotomy position, the head at almost right angles with the spinal column, to introduce the instrument. I tried it on an old man, and found it could not be used, because his neck was to stiff.

Dr. W. O. Roberts: I agree with what Dr. Cartledge has said; it looks very much like a case of stricture, the result of trauma. I have just been to see a young lady who was brought here two weeks ago from a distance. While at a party she said she swallowed a bone, and it lodged in her throat. This was on Saturday, two weeks ago. I saw her on the following Monday with the family physician and another gentleman who pays particular attention to throat surgery, and made a careful examination, but could find no bone in the œsophagus. The following Monday she suffered more and her suffering continued to increase, her throat began to swell on the outside, and last Monday she had great difficulty in swallowing liquids, (from last Monday week until last Monday), then ceased to be able to swallow at all. I examined her this evening, found her temperature 101½° F. She has not taken anything into her stomach since last Monday; both sides of her neck badly swollen, extending nearly up to the angle of the jaw, and on the inside I detected a post-pharangeal abscess, a little to the left of the center, in which is undoubtedly fluctuation.

Dr. C. Skinner: I will report a case in the same line, showing how a man was relieved. About four weeks ago a man came to me from Pineville, having been unable to swallow even water for about forty hours. I tried different sized tubes and could get nothing to pass, and sent him over to the Infirmary with the expectation of going back later in the afternoon and trying it again. Just before my time to go, his brother came over and said he had been able to swallow some water. He accomplished this by filling his mouth full of water and then forcing it down. I gave him some milk which was swallowed in the same way. I then passed a tube about the size of your finger, and it marked two distinct strictures,—one about one and one-half inches below the other. The tube was grasped very firmly at these points. He went home without any further trouble.

Dr. E. R. Palmer: It is very questionable in my mind whether the trouble in Dr. Rodman's case could have been due to syphilis: First, because of the great rapidity of its development, and second, because it should have been followed by very decided amelioration under specific treatment if it were a tertiary lesion. With the uncertain history and the absolute failure of specific agents to have any effect whatever, I should be inclined to attribute the trouble to trauma.

Dr. W. L. Rodman: I accept the theory of trauma. When I made the statement that there was no apparent history of trauma, I meant that he had never swallowed any sulphuric acid, lye or anything of that kind. If there was any traumatism, the patient did not remember it. I think in swallowing some bone it probably lodged for a time, causing simple ulceration, which resulted in stricture.

I am satisfied in my own mind that it is not a syphilitic stricture. In the first place syphilitic strictures of the œsophagus are not so common as some think they are. Then, as Dr. Palmer says, it would not have veloped so rapidly if it had been the result of a syphilitic attack ten or fifteen years ago. I questioned the man very carefully when he was brought into the ward, and am satisfied, from the information he gave me, that he had never had syphilis, but it was simply gonorrhœa. He never had any eruption; never had throat trouble; never had enlarged glands; never lost any hair, and I have no reason to suspect that he had an attack of syphilis.

Dr. D. T. Smith: It seems to me in this case, if there had been trauma sufficient to result in a stricture of this extent, the man certainly would have remembered it.

PLASTIC EFFUSION INTO THE PERICARDIUM.

Dr. C. W. Kelly: Instead of reading a paper this evening, I will report a case

or two which have come under my observation within the past five or six days.

A week ago last Thursday I was called to see a young man, a medical student, suffering with pain over his heart. When I went into the room, I found him very much excited; his pulse was irregular, and on change of position would increase in radidity. It was found, on examination, that there was a plastic effusion in the pericardium, and its movement to and fro with the heart-sounds could be very easily made out. There was nothing peculiar in this case, no accumulation of fluid in the pericardial sac, and nothing except this plastic effusion.

No. 2: The second day after that, one of Dr. Marvin's patients sent for me in a hurry, the message being that a gentleman was very ill. I called at the house and found another medical student who was suffering from a similar trouble, although it differed in some respects. As soon as I went into the room I heard a peculiar noise. I asked the young man who was in attendance what it was, and he said he did not know, but every four or five minutes we would hear that peculiar sound. I can compare it to nothing but the pulling of wet leather from a smooth stone, a sticky,sucking sound. I was very much interested in this peculiarity and the patient was very anxious. The young man said that Sunday night he went to church and while there had a severe pain, beginning at the scapula and terminating in the lower part of the sternum. The pain was so severe that he became anxious and went home. After reaching home he went to bed, lying upon his back, and found that he could not turn over; the pain continued and a physician sent for. This is about the history of the case.

I asked the patient if he had ever had an attack of rheumatism, and he said that he never had rheumatism or a pain of any kind before. Upon examination I found that there was pericardial plastic trouble, and very strange to say, the heart seemed to have become attached to this body of lymph, that I suppose was poured out into the pericardial sac. The pulse was very irregular,—there would be several beats, then an interval, the heart seeming to stick to the lymph. It ranged from forty to seventy-five beats per minute, and I was very much afraid the man was going to die. He was very much excited. I found the to and fro friction rale which had been masked by the first or second sound of the heart. I suspected first that it was pleuritic trouble, the heart rubbing against an inflamed pleura; when I asked the patient to stoop forward, I found that the same peculiar sound continued, and I keep him in the recumbent position, perfectly flat. Yesterday the sound was disappearing; no longer that peculiar action of the heart; pulse had become regular; pain decreasing and altogether the gentleman seems to have convalesced. The other case reported is also in the same condition, convalescence seems to have been established in both cases. I have kept these patients perfectly quiet, would not allow them to get up fearing effusion, although to all appearances they seem well enough to sit up. I have never seen a case before where simple effusion caused such interference with the heart's action, and have been unable to determine the cause in either case reported. As I stated there is no history of rheumatism in either case, and both patients have heretofore enjoyed good health.

DISCUSSION.

Dr. J. B. Marvin: I have seen more cases of pericarditis in dead halls than I have recognized during life. I have one or two very pretty specimens of this plastic effusion. I had a very interesting case of this kind, at the city hospital, in a negro boy where there were the ordinary physical signs of pericarditis and an area of increased dullness; from the appearance I thought of course it was effusion, and inserted my hypodermic needle but could get nothing out by it. I repeated this various times and although I had demonstrated effusion, I could not get it out. Undoubtedly the lymph was so thick that it could not flow.

I was interested in one point made by Dr. Kelley, and it is one that I have been investigating carefully for the last few years, namely the relation between endo- or peri-carditis and rheumatism. I have certainly seen cases where I could not trace any history of rheumatism. In cases where there is no subsequent joint lesion, it seems to me rather doing violence to the true etiology to claim that they are rheumatic in origin, and I am satisfied we have been led astray by the older authorities.

Dr. Wm. Bailey: From the statements made by Dr. Kelly I understand that these murmurs, so-called, were not synchronous with the heart's action. I would like to know if the Doctor counted the repetition of these for a minute so as to get at what was produced. A fluctuation murmur, pericardial, ought to correspond with the heart-beats, just as an endocardial murmur does, or as the fluctuation sounds of pleurisy correspond with the number of respirations per minute. But it is practically competent, I think, for an inflammation to be in one membrane and one of the other membranes produce a frictional sound. It seems to me the fact that fluctuation did not disappear when respiration was stopped, indicates pericarditis. Pericardial murmurs are, as a rule, communicated to the pericardial space; not transmitted, as endocardial murmurs, outside of that space.

As to the question of rheumatism: I think it is safe to say that the majority of these affections, either endo- or peri-cardial, are due to rheumatic causes, whether there are any other manifestations or not. Simply to have no joint complication is not proof that it was not rheumatism.

The interesting point in the case reported by Dr. Kelly would seem to me to be to determine whether it was pericarditis or whether it was inflammation of the pleura so closely situated to it, so nearly related to it, that the motion of the heart might cause fluctuation of the pleura; the quick convalescence and the apparent short course of the case, too, might have some bearing upon the location or character of the disease.

Dr. Wm. Cheatham: I would say in regard to the rheumatic element in these cases, we see a great deal of it in inflammation of the eye. Take, for instance, episcleritis and inflammations of other parts of the eye, without any other manifestations of rheumatism at the time, and many will afterward develop joint complications confirming the diagnosis.

Dr. J. B. Marvin: How do you account for endocarditis following pneumonia? How do you explain cases of ulcerative endocarditis? How do you explain cases of endocarditis following measels and scarlet fever? I think Thomas or Wunderlich puts measels next to rheumatism in frequency as the cause of endocardial inflammation. Certainly the tendency among German authors is to ascribe endocarditis more frequently to bacterial infection than rheumatic influences.

Dr. C. W. Kelly: In reporting the cases in question I did not take into consideration the cause. I am satisfied from observation that both endo- and peri-cardial troubles are often met with aside from rheumatic diathesis. For instance, in Bright's disease you often meet with pericardial trouble which is frequently the cause of death. You frequently meet with pericardial trouble in the course of typhoid fever, and in these cases it is usually fatal. An especially interesting feature in the cases referred to is that this effusion or lymph within the pericardium seemed to control the heart's action, or to change its rhythm. It was to call attention to this fact that I reported the cases.

Dr. Wm. Bailey: It seems to me that a pulse of forty to seventy per minute is a very unusual thing in pericarditis.

Dr. C. W. Kelly: It depends altogether upon the patient. If the patient is kept quiet the pulse will be slow, but if allowed to worry or change position the pulse becomes very rapid.

LEFT LARYNGEAL PARALYSIS.

Dr. J. M. Ray: This specimen was removed, post-mortem, from a negro aged forty-eight years. I saw him first in March; he came to my office suffering from partial loss of voice. Upon examination of his throat at that time, I found a left laryngeal paralysis, his vocal cord being in what we call the cadaveric position,—half way between abduction and adduction. I saw him once or twice and then he passed from under my observation until about the first of October, when he came to me one morning suffering very much from dyspnœa. I sent him to the city hospital and asked Dr. Rodman to take charge of him. Afterward he was presented to the class by Dr. Yandell. On examination of the throat at that time it was found that the left laryngeal paralysis was complete, and the right vocal cord seemed partially paralyzed. We kept him quiet in the city hospital for a few days with instructions that he be carefully watched whenever he had one of the spasms of dyspnœa. He grew better

of this dyspnœa. Dr. Rodman examined him physically and made diagnosis of aneurism of the arch of the aorta although the symptoms were not very decided. In a day or two he was taken with a violent attack of dyspnœa and died. By post-mortem examination we found a large aneurism of the arch of the aorta. Shortly before the patient died the *interne* performed a laryngotomy but it afforded no relief. I assume that the dyspnœa must have been due to the aneurism pressing upon the pneumogastric nerve on that side. How to account for the inability to abduct the cord on the opposite side, I cannot tell.

This case is particularly interesting to me as I have a similar case under treatment now; a man thirty-nine years of age consulted me in April last, and on examination of his throat I found slight interference with the motion of his left vocal cord; he was very hoarse and had acute local symptoms, œdema, etc. Under local applications they all disappeared, and after thoroughly examining him I made up my mind that he had left vocal cord paralysis. I treated him for a while with little or on improvement in the symptoms. Then he went to New York and consulted several specialists there who told him he had paralysis of the left vocal cord, due to aneurism of the arch of the aorta. Then he came back and under large doses of iodide of potassium his voice has improved, but the left vocal cord is still paralyzed. The right cord has taken on the duty of the disabled cord and now he is able to talk in an ordinary tone without any trouble at all. The man has gained in flesh, is perfectly hale and hearty and attends to his business as wholesale buyer for a large drygoods house. To all appearances he is in perfect health.

DISCUSSION.

Dr. Wm. Cheatham: Dr. Ray's case is certainly a very interesting one. By recent investigations of the recurrent laryngeal nerve, all the symptoms can be easily explained. I have just had a similar case in the person of a white man aged about sixty. He died of rupture of the aneurism. This case has a specific history. A post-mortem was held, but the specimen was lost.

Dr. W. L. Rodman: There is very little to add to what Dr. Ray has said. The man was referred to the Surgical Ward and after a very careful examination, I thought I detected an aneurism of the arch of the aorta, and the autopsy has proven that my diagnosis was correct.

Dr. J. M. Ray: I have seen four cases of laryngeal paralysis since the first of January—in addition to the two here reported, I have seen two others. One is a man seventy-six years of age, who has complete left laryngeal paralysis; another a young lady who has complete paralysis of the left vocal cord. No evidence of aneurism can be found in either of these two cases. I notice that Bosworth reports having seen only fifteen cases of unilateral paralysis. Out of the fifteen cases the trouble was on the left side in eleven and on the right in four. Of the eleven on the left side, only four were due to aneurism and he makes the statement that aneurism is not as often the cause of recurrent paralysis as we might at first be led to believe.

GUNSHOT WOUND NEAR BLADDER.

Dr. A. M. Cartledge; I would like to ask Dr. Vance to give us a short resume of a case he reported to this society seven years ago, then I will make a continued report of it. I refer to the boy who was shot in the region of the bladder.

Dr. A. M. Vance: Seven or eight years ago I was called, in an emergency, by Dr. Hays to see a patient who had been shot in the belly. I found a boy about nine years of age, in shock, and with about this history; he had a toy pistol and had bought some Flobert cartridges without balls in them; in endeavoring to load this pistol the bullet that he had put in first would not allow the cartridge to go in, therefore he took a railroad spike to hammer it in; the cartridge was exploded the ball entering his abdomen about two and one-half inches below the navel. Dr. Hays, who was the family physician, was called about half an hour after the accident. The boy was treated for shock, the only symptom or evidence of his having been shot was hæmorrhage from the urethra, which was not very excessive. I saw him again in the afternoon. He had reacted fairly well and recovered without any further manifestations. I told the family at that time that I thought the bullet had entered the bladder and believed, in years to come, an opera-

tion would have to be performed for its removal, as a stone would probably form around it.

Dr. A. M. Cartledge: Some two months ago I saw this patient with a physician of this city, and substantially the same history was given me as detailed by Dr. Vance. From the subsequent history we all believed that it was a case of bullet wound of the abdominal cavity that had gotten well without a laparotomy. The question was discussed for a long time as to the propriety of doing a laparotomy without any symptoms of a general character indicating the operation. When I saw the patient he was suffering from an abscess (which had been opened by his physician) two inches below the umbilicus and a little to the left of the median line. The abscess opened was still discharging. On account of some trouble in his family the operation was postponed, and the sinus closed and they thought he was about well. Two weeks ago the abscess again refilled in the same region and his physician again opened it a few days ago. I then told them to send him to the infimary and I would see if we could follow up the original sinus and locate and remove the offending body. We introduced a probe which could be pushed backward at least five inches, I am quite sure it went behind the pubic bone to the left side of the bladder. Then I determinedto follow it up in this direction; it was dilated apparently to the bottom, but I could not feel any foreign body with the dilator. I then introduced a soft catheter with a curette, probably about six inches in this direction, but it being of soft material could not detect any foreign body. I again introduced the dilator following up the old sinus and finally detected the bullet, but the question was how to remove it, through the very small sinus. After some little difficulty this small bullet was removed from the left side of the bladder-neck. The sinus was packed from the bottom with gauze. I think the bullet could probably have been removed from an incision through the perineum, if it could have been located. He has made an uninterrupted recovery.

DISCUSSION.

Dr. W. O. Roberts: Was the hæmorrhage from the bladder during micturition?

Dr. A. M. Vance: Yes. There was only one hæmorrhage and that was during micturition. The boy was relieved of all his symptoms very quickly; was kept in bed for about ten days. I saw him three times only. He was then about nine years of age.

CASES OF SYPHILIS.

Dr. E. R. Palmer: I have recently seen two cases of chancre in the female, on the right labium minus, occurring as the initial lesion. I suspected syphilis in both cases, but discovered it by being led through other reasons to make an examination. In one case the chancre has been followed by secondary eruption, which is now fading; the other is in bed to-night with syphilitic fever.

Another case is a man who developed chancre eight weeks after copulation. This is the second case which has come under my observation where infection has come from the same female, the patients each supposing they had contracted gonorrhœa.

The fourth case came to my office four days ago with a small but plainly defined chancre to the left of the frænum. The second or third visit he made he called my attention to a fever blister (as he called it) upon his lip, which I found upon examination to be an immense chancre. It was a case of double infection at two distinct points, contracted from the same female and at the same time; infecting his lip from kissing and the penis from coitus.

STUDY AND PRACTICE.

While common sense is an absolute necessity for any profession or vocation, I know of no one where it is more necessary or important than in the study and practice of medicine. If I were asked to define the term common sense, it might be difficult; but it will be sufficient for our purpose, at this time, to say it consists in applying rational, simple rules of construction to the various theories of medical science, adopting and practicing what can be measured by such rules, and rejecting those that are at plain variance and antagonism with them.—*Ex.*

Correspondence.

"THE CONSERVATIVE."

Editor of MEDICAL AND SURGICAL REPORTER: — "Conservative," according to Webster, is, "one who, or that which, preserves from ruin, injury, innovation or radical changes; a preserver, a conserver." "The Conservative," medically speaking, according to a goodly number of writers in these days of "brilliant" exploits, is a back number, a "chump," a doctor or professor whose platitudes are "fatigueing in the extreme."

If there is one quality more desirable than another, in the profession, it is honesty. Honesty of opinion, honesty in criticism, honesty in treatment, medical or surgical. In this light let us look at the "Conservative." He is not necessarily either a fool, or an old fogy; it does not follow that he takes no journals, nor visits clinics, or "Polyclinics." He is just as likely to possess a Sims or a Goodell, as a Ferguson speculum—and more so. You generally find him as the man who has read both sides of the question. He it is, who, when visiting a clinic, takes it all in and thinks, while the other fellow is blowing about the new operation, and getting only a superficial view of the case. "The Conservative," is the man who has not only seen many old theories die out, old treatments set aside; but new theories wither; new treatment fizzle and new instruments condemned that were ushered into the medical world, in a blaze of light and glory. "The Conservative" is the fellow who wants to know before he acts; who thinks before he speaks. He it is, who has learned how much there is yet to learn, and how deceptive are flashes on the horizon. He it is who wants to know if it is the headlight of a locomotive or the moon that is looming up ahead; a sun or a dog sun that is claiming attraction as a new light. It is not the "Conservative" who never makes a "safe hit." He strikes when he gets ready and is sure to make "first base;" he watches for the safe time to make each succeeding base. He may keep back the impatient fellow "at the bat," but it won't hurt the batter to have time to think a little. It is your "Radical" that generally gets "out on first," seldom reaches "second," and rarely, if ever, "third." Once in a while a fellow who has looked over the whole field and studied the situation, knows his time has come, strikes and makes a "home run;" but he is one of the very few, and his success was due to "Conservative" thinking, not to "Radical" rush. It is not your "Conservative" who writes:—

SOONERVILLE, April 1st, 1892.

MESSRS SMITH & DUBS.

Gentlemen: It is most gratifying to be able to report that since I added your "Smith's silent perambulating pills" to my armamentarium, I have had three cases of Leucæmia in which they were exhibited. Recovery was rapid in cases one and two. But in case three, owing most probably to inefficient and partly ineffectual absorbtion, resolution was prolonged about ten days. A difference of 50 per cent. compared with cases one and two. The profession owe you a deep debt of gratitude. I shall continue to use your S. S. P. P's in all cases. Please send me another dollar's worth.

Very fraternally yours,

JOB LOTS, M. D.,

Gilhooly Col., '89.

It is the "Conservative" however who, after reading similar certificates, piously exclaims, "The good Lord help that fellow's patients, when they do get sick!" It is the "Conservative," who knows that patient has a liver, spleen, kidneys, stomach, *and* "other things," and finds out "how they are," and "how they have been." It is your Radical, who says, "Let me see your tongue, please. Ah! I thought so, I will have to make a vaginal examination."

Your conservative physician says, "we will try injections." It is the radical who exclaims, "give him mercury, it will go through him, or bust a gut." It is your conservative surgeon who say, "I can save that leg." It is the radical that utters, "whack it off, I'll do a semi-circular with a triangle trim, flaps too ancient." It is your conservative gynecologist who says, "this patient is a woman, I will try and keep her a woman, with all her womanly functions intact." It is your radical who says "I'll extirpate these ovaries, and shorten that round ligament. She will never be a mother, and that probably suits her, and positively suits me, for here is, name, fame, and three hundred dollars."

"He pleasantly smiles when the deed, it is done,
Saying, 'Pinko Chanky, isn't it fun.'"
(*Apologies to the author of "Witilsee Whanko whoo."*

It is the conservative gynecologist who knows, that it was the mental effect of an operation for a supposed ovarian disease that cured, at least for a time, the real neurosis. It is your conservative, who knows, that healthy ovaries, have been removed to cover up faulty diagnosis; and who realizes, that, if what is now said about the necessity or advisability of abdominal surgery were all true, a large per cent. of his female patients would have joined the great majority long ago. The conservative knows a good thing when he sees it, or it comes to him mentally. He knows a "craze," and has it sized up while the radical is trumpeting his short lived triumph. He it is, who thinks of the awful *unwritten* history; while he is ready to sanction, or to operate to the extent of his ability, when operation is justifiable. It is he, who knows that not even a respectable minority of practitioners have it in them to be experts in gynecology, or special surgery. It is all very well to poke fun at the poor tyro with his "Ferguson" and his tampon; his sound and his battery; but it is a burning shame on the medical profession to advocate, in the same breath, the ruthless and often unnecessary, destruction of the womanly functions. Dr. G. G. Shoemaker, a Penna. University man, and one of the best fellows, in the world, remarks to me, in this connection, this—"My own opinion is, that in a majority of cases, it is the *other* sex that should be attacked. That this world would be better, and freer from disease, physical and mental, if a little judicious *castration* were performed. This would not interfere with the peeling of bark, drinking whiskey, pumping beer, parting his hair in the middle, or wearing an "oy gloss y' knaw," but it would cut down the production of criminals, imbeciles and lascivious libertines."

That idea is a good one. Now in the not distant future, when the conservative has caught on to the good, and knocked out the bad, in present pelvic surgery, the radical will have to take a new departure.

The doctor's idea, will give him a starting point. Let the radical castrate for a—well, let us say, a gonocaccus; amputate in part or wholly, the penis, for ulcer or stricture; and in the mean time, fire hot shot, into the old bougie, syringe, caustic, mercury and iodides. The more you think of it, the more one sees that this doctor is right. The results normally and physically would outstrip present methods, and this world would be better. But, alas! the male would not put up with it, or *for it*. He prefers, as ever, to let the woman bear the penalty.

However, the doctor's idea is too radical for the purposes of this paper, and we go back to the "Conservative."

I had a patient come to me, whom three experts, (and I say experts as those "away up" in their speciality), had declared, had diseased ovaries, and "they must come out." I did not think so, and after a careful examination wrote the whole history of the case, and symptoms to Prof. Goodell. Result, I was right and experts wrong. Rest, Blaud's pills, corrosive sublimate, and the despised "Smith Hodge" pessary did the work. Another patient, who was certain she had all the ills the female pelvis is heir to; who had been treated again and again, was cured by simply staying in bed. I gave her an essay of Dr. Goodell's to read, which so accurately described her case that its mental effect largely aided the cure. These are only trifles by the wayside, but they are trifles that are repeatedly magnified into conditions for operation.

Your "Conservative" knows that he must be prepared to do a Cæsarean section; but he also knows that if he is going to make a business of abdominal surgery he must have the conditions right. First, right himself; second, surroundings right—patient under constant surveillance by trained nurses, with skilled fingers and perfect cleanliness. If he can't have these, and all these, he won't operate (unless in an emergancy) and he is foolish if he does. Better, far better for him and patient, to let her go where all these things can be had. I almost fancy, I hear some good-natured Radical softly singing at this point:

"Oh! Mother, may I go out to swim?
"Yes! my charming daughter,
"Hang your clothes on a hickory limb,
"But, don't go near the water."

That is all right for him but, here's to the "Conservative" brother—I am not sure I belong to his tribe. I am afraid I am somewhat mixed. But, here's to him! To him, I lift my hat, and I drink his health in spring water. He is a royal good fellow; the great balance wheel that keeps us all in check, and prevents the Radical from annihilating the whole race in order to preserve a specimen.

ISSUED EVERY SATURDAY

ADDRESS:

Care P. O. Box 843, Philadelphia

PENFIELD BROS., Publishers.

NOTICE TO CONTRIBUTORS.

We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

Terms. Five dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

Remittances should be made payable only to the publishers, and when in sums of five dollars or less should be made by Postal Note, Money Order or Registered Letter.

THE MEDICAL AND SURGICAL REPORTER.

SATURDAY, DECEMBER, 24TH, 1892.

MEDICAL LEGISLATION IN PENNSYLVANIA.

ABSTRACT OF BILL UNANIMOUSLY ADOPTED FOR PRESENTATION TO THE LEGISLATURE BY THE MEDICAL SOCIETY OF THE STATE OF PENNSYLVANIA.

1. The Board shall consist of nine members, graduates of some legal medical school, "no two of whom shall be residents of the same County, and none of whom shall be a member of the faculty or staff of any medical school or university."

2. The members shall be appointed by the Governor by and with the advice and consent of the Senate.

3. Only physicians commencing practice in Pennsylvania after July 1, 1893 "shall be examined in anatomy, physiology, chemistry, pathology, hygiene, toxicology, differential diagnosis, surgery, and obstetrics; and each applicant, upon receiving from the secretary of the board an order for an examination, shall draw by lot a confidential number, which he or she shall place upon his or her examination paper, so that when said papers are passed upon by the examiners the latter shall not know by what applicant said papers have been prepared, and upon each day of examination all candidates shall be given the same set of questions."

4. The examination papers and marks shall be preserved and shall be open to public inspection in case of dispute. "No one shall be excluded or rejected on account of adherence to any special system or school of practice."

5. "Each applicant who shall have passed a satisfactory examination shall receive from the said board under seal a license to practice medicine and surgery in the Commonwealth of Pennsylvania.

6. "Nothing in this act shall be construed to prohibit service in cases of emergency or the domestic administration of family remedies."

7. The applicant shall pay an examination fee of ten dollars and "in case of failure at any examination shall have the privilege of subsequent examinations without the payment of an additional fee."

The Committee of the State Medical Society has just issued a pamphlet calling the attention of the profession to the necessity of urging the Legislature to pass the bill prepared for the creation of a State Board of Medical Examiners. This pamphlet gives the views of physicians from all parts of the State, and shows that the desire for some legislation to protect the public from ignorant practitioners is a general one. The legality of such legislation is proved by extracts from decisions of the Supreme Courts of the various States and also from the Supreme Court of the United States. A very forcible quotation is given from the decision of Justice Field of the United States Supreme Court. He says:

"No one has a right to practice medicine without having the necessary qualifications of learning and skill; and the statute only requires that whoever assumes, by offering to the community his services as a physician, that he possesses such learning and skill, shall present evidence of it by a certificate or license from a body designated by the State as competent to judge of his qualifications."—(U. S. Supreme Court, 129 U. S. 114).

There are already twenty-four States and Territories which require physicians beginning practice within their limits to exhibit their proficiency and knowledge before medical authority established by State law.

The fact that separation of the licensing power from the teaching power is earn-

estly advocated by President Eliot, of Harvard University, is strongly brought forth. Such an opinion coming from one who is interested in education, and yet not a physician, carries great weight.

The pamphlet gives the Faculty Resolutions of the Jefferson College, the University of Pennsylvania, the Woman's Medical College and the Polyclinic endorsing the bill. This shows that these progressive and broad-minded medical schools are fully aware of the risks of allowing teachers of a faculty to confer licenses to practice.

The members of the State Society must certainly be gratified to see these well-known schools take such high ground in advocating reform which has been so long needed.

Dr. Millard, of Minneapolis, has truly said that the enemies of a State Board of Medical Examiners principally include the representatives of those colleges governed by *commercial* interests, whereas, the friends of medical legislation include the mass of the profession and those who represent the better colleges of the country. The general profession well know that the opposition to the Medical Examiners Bill usually comes from the "two year's" schools and from those who are afraid that their graduates cannot stand a reasonably searching State examination.

Copies of this document can be obtained from the members of the Legislative Committee of the Medical Society of the State of Pennsylvania, the Chairman of which is Dr. H. G. McCormick, of Williamsport.

The REPORTER hopes that every honorable effort will be made to support the bill and to assist in its enactment as a law.

ANÆSTHETIC SALVE FOR HEMORRHOIDS.

The following is given in *Med. Chir. Centralbl.*

℞
Cocaine ..... grs iij.
Morphia ..... grs. ivss,
Atropine sulphate ..... grs. iij.
Tannin ..... grs. iijss.
Vaseline ..... 3v.—M,
Apply after each evacuation of the bowels.

Translations.*

BY MARIE B. WERNER, M. D.

Operative Treatment of Epilepsie, by Dr. H. Kümmel, of Hamburg (*Deutsch Med. Wochen.*, 23, 1892). The author reports seven cases of genuine epilepsy, on whom he attempted various operative procedures.

In the first two patients he followed W. Alexander's method, and ligated the vertebral artery, but neither the unilateral, or later the ligation of the opposite artery, resulted in any but a passing improvement.

Alexander's theory being, that by ligation of the vertebral artery, some of the nerve fibres of the sympathetic passing from the ganglio cervicale superius, are included, which severs their connection with the superficial portions of the brain.

W. Alexander even extirpated the ganglion in question with the hopes of producing a cure. The author also extirpated it in a womon æt, 46, with but transient improvement.

Trephining was practiced by Kümmel in five cases of genuine epilepsy, in which there was no history of trauma, nor was it possible to localize definitely the seat of the motor center affected by the history of the attack, a persistent painful spot, however, always showing itself after the attack; served as a guide to the operator, and the desirable results attained after trephining, served as an encouragement to the author. There were no appreciable anatomical changes found.

The most favorable results however gained, are in those cases of so-called Jacksonian Epilepsy produced by trauma. Kümmel operated in three such cases, excising portions of abnormal dura mater with complete cure in two cases.

The author further reports a case of Iodiocy in a three year old boy who had a deep depression below the lamdoid suture —resection of the depressed portion resulted in recovery and marked mental improvement.

Dr. H. König, of Hermanstadt, (*Münch Med. Woch.*, 1892) presents a very interesting account of the recovery of six corpses which were forcibly thrown out of the Echo-schaft, with large quantities of

* Translated for MEDICAL AND SURGICAL REPORTER.

water, during a severe storm July 3, 1890. They were found floating on the top of the Iod-Soolbad-Salzburg.

Careful examination proved them to have been victims from the battle near Salzburg, February 4, 1849. They were all excessively heavy; the tissues were thoroughly macerated with salt water; quantities of salt crystals were found internally; rigor mortis was present to a slight degree; no decomposition; the odor compared to pickled meat; and they appeared like bodies kept a long time in alcohol.

The skin was ashy gray, hard, smooth and devoid of hair; the mucous membrane pale. The nails were incrustated with a thin, yellowish substance.

The bodies being frozen when thrown down the shaft, presented quite plainly the injuries received, *i. e.*, fracture of the skull, punctured and shot wounds and injuries from blows.

The integument on being cut, looked much like bacon, the internal organs were apparently fresh—for instance, the liver substance on being cut, was dark brown in color, and its structure well preserved. This state of preservation was found in all organs except the brain, which had changed into a reddish-gray fluid.

Kümmel calls attention, 1st. To the wonderful conserving properties of the water in the Echo shaft.

2d. That the fluid entered into the deepest structure, crystals having been found in the spongy portions of the bone.

3d. That the number of years (41) which elapsed since the bodies had been exposed to the action of this fluid, gave ample proof of its penetrating qualities, since crystals were found in organs entirely shut off from direct contact.

For these reasons Kümmel thinks this water can easily take the place of the more expensive alcohol for museum specimens. A chemical analysis has not yet been made.

Buglioni—Fracture of the spinous process of the seventh cervical vertebra—(*Raccoglitore Med., 1892, June 20*). Patient, a boy between fourteen and fifteen years, while playing was thrown face downward, another boy falling upon him, his elbow resting upon his neck; the little patient at once experienced a sharp pain. On being examined a few hours later Buglioni found a complete separation of the spinous process from the seventh cervical vertebra. Absolute rest and proper bandages resulted in complete union in twenty days. An isolated uncomplicated fracture of this kind is certainly of rare occurrance.

Holländer, in his studies on the use of Pental as an anæsthetic, (*Deutsch. Med. Wochen 1892. page, 857*) after having used it for some time, presents the following conclusions: 1. Pental is in all cases an active anæsthetic; it differs in this from Bromide of Ethyl, which has failed in some cases. 2. Anæsthesia sets in more slowly than in Bromide of Ethyl but lasts longer and the patients recover from its influence more slowly.

3. Holländer has never noticed nausea or vomiting follow its use, and but rarely observed any symptoms of excitation.

4. Neither respiration nor the heart is influenced during narcosis—exceptionally there has been a slowing of the pulse in the anæmic or a slight increase in the excitable.

5. For some patients 2-3 c. c. are sufficient to induce narcosis; in all cases as a rule 10 c. c. are sufficient.

6. The excitable or markedly anæmic patients with weak heart's action, or old bronchial catarrh, do not stand Pental well.

7. The Junker apparatus is best adapted for its administration; the fumes are kept from the eyes, a smaller quantity is used, the unpleasant odor is not so easily noticed and the quantity can be regulated.

8. Narcosis is complete in one to three minutes.

Schmidt—Acute primary hæmorrhagic encephalitis (*Duetsch. Med. Woch. 1892*). A girl of nineteen, having enjoyed previous good health, having been subjected to some undue strain, began to suffer from intense general headache and vomiting; this was soon followed by apathy, and short epileptiform attacks, the latter increasing in frequency. There was occasional conjugated deviation of the eyes to the left, slow respiration, coma and death. Section, revealed hemorrhagic encephalitis, red softening of both optic thalamus and corpora striatum, extending farther to the left; blood in both lateral ventricles, most in the left.

Abstracts.

MEDICAL EXAMINING BOARD OF VIRGINIA.

We append a few of the question that were presented to the candidates at the examination held at Alleghany Springs, Sept. 14 and 15, 1892.

As the questions in the different sections were very fair and cover considerable ground, we give a few, for the study of those interested in efforts to advance medical education.

SECTION ON CHEMISTRY.

Q. 4. "What are alkaloids? mention three of the more important, and give the physical and chemical properties of each."

Q. 5. "What are the properties of ozone? In what respects does it differ from oxygen?"

SECTION ON ANATOMY.

Q. 1. "Describe the anterior cerebral fossæ."

Q. 2. "Name and describe the ligaments of the knee-joint."

SECTION ON PHYSIOLOGY.

Q. 1. "Give the physiology of the lymphatic system, so as to include the following items: (a) Anatomical structure and arrangements of lymphatic vessels, from their origin in the tissues, to their place of communication with certain veins. (b) Special office of lymphatic glands."

Q. 6. "What effects follow section of the facial nerve after exit from the stylo-mastoid foramen?"

SECTION ON MATERIA-MEDICA.

Q. 5. "Name the most efficient antispasmodics; Give doses of each."

Q. 6. "What are "excito-motors" and what are depresso-moters? Give examples of each group with doses.

SECTION ON OBSTETRICS.

Q. 1. "To what diseases are pregnant women most liable? Give pathology of each."

Q. 4. "What measures are absolutely necessary to prevent septic infection during the process of parturition?"

Q. 5. "Give diagnosis of pelvic peritonitis, its treatment and possible sequelæ."

SECTION ON PRACTICE OF MEDICINE.

Q. 2. "Give the symptoms and physical signs of aortic insufficiency and diagnose it from mitral obstruction."

Q. 5. "Differentiate broncho-pneumonia from lobar pneumonia."

SECTION ON SURGERY.

Q. 1. "Diagnosis and treatment of penetrating wounds of abdomen, with visceral lesions."

Q. 3. "Differential diagnosis in detail of chancre and chancroid."

Q. 5. "Symptoms of arthritis and synovitis."

Q. 6. "Differential diagnosis of tetanus, hydrophobia, and spinal meningitis."

INTUBATION OF THE LARYNX.

Dr. James B. Ball, of London, gives an interesting report of twenty-two cases of intubation of the larynx in (*The Lancet*, Nov. 26, 1892). Sixteen occurred under the care of some of his collegues at the West London Hospital, the remaining six belonged to his private practice. All were children ranging in age from thirteen months to eight years. Of the twenty-two ten recovered. Intubation was performed in every case for symptoms of acute laryngeal stenosis which threatened the life of the child, and as the alternative of tracheotomy. In two cases the laryngeal trouble arose from traumatic causes,—in one from swallowing very hot tea, in the other from swallowing carbolic acid. The rest were cases of laryngitis, simple or membranous (diphtheritic); it was not always possible to distinguish which.

In five cases the disease was secondary to measles, four of these died. In seven cases tracheotomy was performed after intubation had been tried, principally because the tube seemed to be clogged with membrane or secretions. All of these died.

In the cases which recovered the tube was left in the larynx for periods varying from three to thirteen days, the average period for the ten cases being eight days. The thread was allowed to remain *in situ* in four cases, and in one of these it is noted that the child dragged the tube out by its means. In the rest of these cases the thread was removed immediately after

the introduction of the tube. The author thinks it the best plan to remove the thread at once.

In two cases an ulcer was found *post-mortem* on the anterior wall of the trachea, at a point corresponding to the position of the lower end of the tube. It is only right to mention that the tubes used in these cases were not constructed in accordance with O'Dwyer's later patterns.

The author continues to say: "I have no intention here to make any remarks on the value of intubation or on the relative merits of intubation and tracheotomy.

I will merely say that in two of my own cases both of which recovered, tracheotomy had been previously recommended as the only chance of saving the child's life, and had been declined by the parents owing to the slender hope which was offered even if the operation were performed.

In both these cases they gladly consented to the mild and bloodless operation of intubation, although I only held out an equally slender hope of recovery. In this way I feel sure that some lives may be saved by intubation which would otherwise not be saved, and, moreover, the operation is not so likely to be deferred until the child is *in extremis* as tracheotomy often is."

"INFANTILE RESPIRATORY SPASM."

In a paper recently read before the Edinburgh Medico-Chirurgical Society, Dr. Thompson gave a short account of five cases that had come under his observation in which this curious and interesting condition had existed. It is also known as congenital laryngeal stridor, or infantile laryngeal spasm, and Dr. Gee has described a similar, although somewhat different, condition under the term "respiratory croaking." Of Dr. Thompson's five cases, three were boys and two were girls, whereas in all previously recorded instances where the sex is mentioned it seems to have been confined to girls, and the condition is often said to occur only in female children. As regards family history and general health, there is nothing of very great significance, except that in four of the cases more or less indigestion was present. In none of the patients was rickets apparent when the children were first seen, but it appeared later in those longest observed. There was no sign of congenital syphilis in any of the cases, and intellectual development seemed perfectly good. The onset of the stridor was noticed in three instances immediately after birth, in one infant it was not observed until a week, and in the other a fortnight later. As regards the course of the malady, Dr. Thompson says that in very severe cases the stridor goes on increasing in loudness during the first two or three months and then tends to subside spontaneously, and as improvement goes on the intervals become longer and the sound less loud, that accompanying inspiration, the crowing sound, disappearing first, while the croaking may still be present at times. After the stridor has ceased to be heard under ordinary conditions it may appear if the child is specially excited or angry; when the stridor is present inspiration begins with a croaking noise and ends in a high-pitched crow. When the breathing is quiet the latter does not occur. Expiration is accompanied by a short croak when the stridor is loud, but at other times it is noiseless. As regards other symptoms, the indrawing of the chest-wall and the episternal notch were well marked in four of the cases, but the alæ nasi did not move with the respiration, and there was a striking absence of distress or cyanosis. Variations in the intensity of the sounds were not uncommon and there were occasional intermissions, even when the condition was most constant and severe. The sounds were notably intensified by mental perturbation, more so, apparently, when the child was excited and apprehensive than when actually crying. Sleep seems to have no constant effect on the condition, and it does not cease when the tongue is depressed, nor even when the nostrils are closed; and when the child is taking the breast there is still sufficient air entering the nostrils to cause loud stridor. The effect of the ailment on the general health is not great, and the most effective treatment apparently is by regulation of the diet and other general precautions. Dr. Thompson regards the condition as due to spasmodic muscular contraction, the cause of this being some central disturbance of function, and he considers it closely analogous in nature and etiology to ordinary speech stammering, both being the result of defect in the proper co-ordinating mechanism.—*Lancet.*

COLLAPSE AFTER OVARIOTOMY—TRANSFUSION—RECOVERY.

DR. LEONARD REMFRY.

Married woman, aged twenty-eight, admitted to Great Northern Hospital, October 12, 1892. Examination showed a large, rounded, fluctuating tumor of the abdomen, rising to within three inches of the ensiform carthlage; more prominent on the right side. Dr. Remfry operated. There were no adhesions. The tumor, which contained a dark grumous fluid, was for the most unilocular, containing but a few secondary cysts; the pedicle was broad and contained some unusually prominent vessels; these were first all tied separately and then the rest of the pedicle secured in the usual way, including the first ligature. The stump was returned perfectly dry. The patient took the chloroform well and the operation did not occupy more than forty minutes.

Five hours after the operation, the patient began to vomit and retch repeatedly and became restless. Temperature subnormal, pulse 120; restlessness and pallor increased and she complained continually of pain in the left iliac fossa; one and a-half hours later, the pulse 140, could scarcely be detected at the wrist. Ether and brandy were given hypodermically and champagne by mouth with no improvement; examination per vaginam proved Douglass' pouch apparently empty. The extreme collapse contraindicated surgical interference. Transfusion was resorted to as a last chance, salt and water (one and a-half drachms to the pint) at a temperature of 110° injected into the right median basilic vein. Two and a-half pints were injected with numerous short intervals. After half a pint had been used a distinct improvement was noted, which continued steadily; nutritive enemata were also an important feature of the treatment; the thirst was controlled by occasional sips of hot water. Eleven days after the operation she was practically well.

Dr. Remfry closes the report with the following remarks: "The case is a highly interesting one—first, because of the extreme collapse so gradually developed, and, secondly, because of the equally gradually-developed recovery and the efficacy of transfusion. What was the cause of the collapse? It is impossible to speak with certainty. Was it hemorrhage or was it one of those obscure disturbances of sympathetic origin? Against the theory of hemorrhage it is impossible to bring forward any one decisive argument. The following details should not, however, be lost sight of, as collectively they are important. (1) the special care with which the pedicle was tied and its bloodless appearance before the abdomen was finally closed; (2) the steady improvement under transfusion, without the occurrence of any further, even temporary, collapse; (3) the absence of the least resistance in Douglass' pouch; (4) the almost normal respiration throughout. I many add that beyond passing a sponge into the pelvis and feeling the left ovary with two fingers there was no manipulation inside the abdomen." —*Lancet, Nov. 26, '92.*

CHRONIC DYSPEPTIC STATES TREATED BY MENTHOL SPRAY THROUGH THE STOMACH-TUBE.

In the *International Medical Magazine*, November, Dr. A. L. Benedict reports several cases and says:

The technique of the administration of menthol through the stomach-tube is simple. The patient should be directed to take no food within at least four hours of the time of appointment and the last meal should be a light one. Lavage is practised in the ordinary way, using plain water or a weak alkaline solution of about the body temperature, and repeating the washing until the fluid returns free from shreds of mucus. The water is removed from the stomach by siphonage as completely as possible, stripping and shaking the tube to remove the water remaining in it. The contact of the tube with the walls of the stomach is apt to excite retching. Haste should be made, therefore, to distend the organ with the spray from the atomizer. The writer uses a one- to five-per-cent. solution in any of the colorless substitutes for the crude officinal liquid petrolatum. The form of the atomizer is a matter of indifference, as almost any of the cheap nickle-tube perfume atomizers will spray an oily solution. The spray is then directed into the funnel, a piece of cardboard being used to prevent a rebound of the vapor from the sides of the funnel, or the funnel may be removed and the tip of the atomizer introduced into the lumen of

the tube. For a minute or two the vapor from the atomizer will meet with some resistance from the small amount of water remaining in the tube, and on auscultation a bubbling may, at times, be heard in the stomach. The vapor, like the fluid previously used, should have an alternate ingress and egress. By pinching the tube close around the tip of the atomizer the stomach may be fully distended and it should then be allowed to contract upon its gaseous contents, when the vapor and even drops of water will be expelled with considerable force from the mouth of the tube. No better proof of the fact of the entrance of the spray into the stomach can be afforded than the almost invariable statement of the patient that the peppermint can be tasted in the mouth, which it can reach only by regurgitation through the œsophagus outside the stomach-tube or through the blood circulation. After having forced the vapor into the stomach, and having allowed the stomach to contract upon its gaseous contents six or seven times, it is safe to assume that the walls of the organ have become as thoroughly coated as would the pharynx or the nose after the same number of applications, barring the fact that the vapor has to follow a longer course and that the surface to be medicated is of much greater area.

The finely-divided spray of an oily solution of menthol distends the stomach symmetrically with little tendency to gravitate to the greater curvature and without straining the ligamentous and peritoneal attachments of the stomach. The vapor diffuses itself in all directions, touching almost every cell of the mucous membrane with a tiny oil globule holding in solution a small amount of menthol. In the aggregate, the clean surface of the stomach is coated with a medicated film of inert mineral oil. This film forms an antiseptic dressing for the mucous membrane, has little if any irritant action aside from the excitation of the menthol, and is, for the most part, brushed off by the first food which enters the stomach. The action of the menthol must be almost entirely local, for the oily solution, though strong enough to act on the mucous membrane, is not used in sufficient volume to make the constitutional action of menthol noticeable.

The value of the menthol spray has been so thoroughly demonstrated in the treatment of more accessible mucous membranes that it seems pardonable to report this new use of it without waiting for a longer series of cases or a greater lapse of time to speak more emphatically in favor of its local action in the stomach. The nine cases reported (and several others not mentioned in this paper) seem to show that the use of the menthol spray in cases of atony or catarrh of the stomach is followed by at least temporary benefit.

The use of other remedies in spray form is suggested.

PERCHLORIDE OF IRON IN PARALYSIS OF THE BLADDER.

Dr. G. S. Roads, in the *Massachusetts Medical Journal* (Nov.), reports the case of a man, æt. seventy-four, who had been subjected to attacks of retention of urine, which were formerly relieved by warm baths, etc. He was suddenly called, and found the patient suffering greatly from retention of urine, which was drawn off. An enlarged prostate was found.

The catheter was passed for several days until the urethra becoming very irritable and the patient rapidly getting into a typhoid condition.

There was not the slightest attempt at contraction of bladder.

He then injected into the bladder six ounces of a weak solution of tincture of iron, which was allowed to remain about half a minute. A slight contraction immediately followed, and small quantities of urine were passed during the day, voluntarily.

Improvement was then rapid, and he has had no trouble since (one year). There could be no doubt that the injection effected the cure in this case as no other medicine was given save a simple aperient.

CHRONIC DIARRHŒA WITH INTESTINAL FERMENTATION.

THERAPEUTICS.

THE TREATMENT OF CHOLERA IN THE ALTONA HOSPITAL.

Dr. Du Mesnil has had under his observation about five hundred cases during the last epidemic. To destroy the bacteria *in situ* he administers calomel in seven-grain doses twice in the course of two hours, following with grain doses every second hour, believing this to be of more value than salol, creolin, or other cresol preparations. Further antisepsis he obtains with Cantani's tannin injection (10: 2000). To meet the indication presented by the abstraction of water from the tissues and thickening of the blood and the resultant symptoms, he employs the sodium chloride infusion injected into the veins. He stimulates the heart, when it is required, with camphor, makes use of baths, 90° to 96° F., and relieves vomiting and muscular cramps in legs by morphine. The morality, excluding the cases of diarrhœa when the diagnosis was not established, was fifty-eight per cent.—*Müch. med. Woch.*, 1892.

ARSENIC AS A PROPHYLACTIC.

Dr. C. E. Bryan, in his address as President of the Leicester Medical Society, stated that he had been led by a paragraph in the *Practitioner*, some ten years ago, to the effect that persons taking arsenic were insusceptible to vaccination, to try the drug as a prophylactic in scarlet fever. He believes that an epidemic was checked in the Leicester Workhouse in 1882, and mentioned that a year later, in a family in which one child had severe scarlatina, he put the other two children on arsenic, and they did not take the disease, though they continued to be about the patient until her death three weeks later. In another family a boy, aged seven, had scarlet fever, but the four other children, whose ages ranged from three to eleven, did not contract the disease, and the mother, who aborted during her attendance on the child, did not suffer. He also advanced some evidence suggesting the value of arsenic as a prophylactic against diphtheria and influenza. He gives gr. one-fortieth of arsenious acid in pill, or m ij of liquor arsenicalis, in mixture three times a day for the first week, and afterwards twice a day.—*Br. Med. Jour.*

THE ANATOMICAL CHANGES IN POISONING BY SUBLIMATE.

Dr. Andrea Calantoni presents a very thoroughly scientific and carefully prepared paper, based upon the literature and upon experiments in the laboratory, from which he deduces the following conclusions: The sublimate penetrating into the blood is eliminated by the kidneys (in a large part) and by the intestine, giving rise, in these organs, to changes of a necrotic nature. In the kidneys, a single large dose being followed by death in a few hours, no changes, save small hemorrhages in the inter-cellular tissues, are found. If life is prolonged from five to ten hours there is found cloudy swelling of the protoplasm; if still longer, epithelial necrosis is clearly shown. In some cases of subacute poisoning there is found a deposition of lime, but differing from the calcareous metastasis of Virchow, in that it is a calcification of single elements and not a secretion of lime from acute decalcification of bone or modification of diffusive power of the renal filter. In the intestine the alterations are chiefly found in the large intestine, and consist of hyperæmia, hemorrhage, and necrosis at the summit of the folds, presenting all the characteristics of a diphtheritic process. There is apparently no relation between the severity of the renal and intestinal lesions. The results of necropsy do not furnish a sure, but only a probable anatomical diagnosis.—*Giornale del. Assoc. Napolitana de Med. e Natur.* 1892.

THE USE OF STRYCHNINE AND DIGITALIS IN DIARRHŒA.

Mr. Harold Hendley notices that, in fevers of a remittent character, the complication of persistent diarrhœa occurred frequently, and at periods when the patient was worn out by fever and the digestive powers were rapidly failing, determined to use these drugs to combat certain symptoms. In these cases the temperature ranges from 1° to 1½° above normal, the pulse is soft and yielding, not very rapid, and markedly wanting in tone; the motions, four or five daily, increase in number until nourishment appears to excite an action of the bowels, marked by even a greater tendency to fluidity, the extreme being reached when the motions escaped involuntarily, and is followed by a tendency to cardiac failure, if not collapse, frequently accompanied by a consciousness

of approaching dissolution in the patient. Digitalis was chosen for these cases because of its well-known general action upon the vasomotor system, strychnine for its less-known more direct action upon that portion of the system concerned in the control of the blood supply to the intestines. The mixture employed was tr. digitalis, miv; liq. strychinæ, mij; spts. chloroformi, mv; in water, and repeated at from one to four hourly intervals.—*The Practitioner.*

THE TREATMENT OF CERTAIN REBELLIOUS HEMORRHAGES BY COUNTER-IRRITATION OVER THE SPLENIC OR HEPATIC AREA.

Dr. L. H. Pettit, calling attention to the close relationship which exists between spontaneous hemorrhages and chronic diseases of the liver, regards the logical treatment of this symptom to be the application of counter-irritation over that organ. *En résumé:* in the event of an abundant spontaneous hemorrhage, or if it is repeated, it is necessary to examine with care the condition of the liver, spleen, and kidneys, and if these organs are diseased it is indicated, at least as far as the liver or spleen is concerned, to apply a cutaneous revulsive more or less energetically in these regions—either blisters or the actual cautery. A milk diet is indicated in the case of nephritis. Perhaps it is advisable that we should also employ digitalis in hemorrhages due to cardiac disease. The intensity of the necessary revulsion varies according to circumstances; in some cases vesication for an hour is sufficient, in others energetic and repeated applications are necessary. —*L'Union Médicale.*

VERATRUM VIRIDE IN PNEUMONIA.

Let me recapitulate. Don't bleed unless you want to. You will occasionally lose a patient, perhaps, by not doing so, but never mind. Maybe he would have died anyway. Don't give antimony unless you feel like it, or a calomel cathartic either, but give veratrum, whatever else you do, and don't get worried when your patient's pulse gets down to sixty or thereabouts, but just hold it there and keep the heart from forcing blood into the inflamed lung at such a terrific speed. Some authority, that I can't lay my hand on just now, says that there is no more reason for controlling the circulation with an inflamed lung than with the inflamed Peyer's glands of typhoid fever. Don't you believe it. The pulmonic circulation is one-half that of the entire body, and anything you can do to lessen the engorgement of lung tissue will diminish the chances of your patient's dying of heart-failure from lack of proper æration of the blood, and will hasten resolution, vagus or no vagus. But don't give opium.

Finally, permit me to say that with this method you have a positive treatment, so simple and so plain that the wayfaring man, though a diabolical idiot, can understand it, and it means business. And, further, allow me to add that, if you permit your patients to die with uncomplicated pneumonia, somebody is to blame, and an action for malpractice should stick on you quicker than in case of death from lack of the use of antiseptics in midwifery.

Lastly, this is not an idle fancy or a theoretical problem, but a hard and horny-handed fact, proved, not by a few years of hospital training, supplemented by a diaphanous general practice, but by over a third of a century of rough and blistering experience in active practice, where pneumonia was one of the commonest diseases, and I can say with truth, as before intimated, that during all these years I have never lost a single case where the disease was uncomplicated, and very few that were. Furthermore, I never expect to. When gentlemen can formulate a plan productive of better results, it will be time for me to consider it.—*E. B. Ward in American Lancet.*

MEDICINE.

EMPYEMA.

Herz (*Centralbl. f. klin. Med.*, October 15th, 1892) maintains, in reply to Rudolph (Epitome, May 28th, 1892, par. 468), that, except in some unusual cases, resection of a rib complicates the operation as washing out the pleural cavity does the after-treatment. The delicate pleuritic adhesions by which the re-expansion of the lung is maintained are broken down by the washing out and the recovery delayed. Any masses of lymph find their way out through a sufficiently long incision kept open by two drainage tubes, or

are absorbed without retarding recovery. The washing out is said by Rudolph also to exert a certain influence in producing deeper respiratory movements, and in thus favoring the more rapid re-expansion of the lung, but the same effect can be brought about in other ways. It is also stated that the washing out cannot be omitted in cases of fœtid empyema, but Herz points out that a thorough disinfection of the parts is not possible, since the infective process is not limited to the mere surface of the pleura. A case of fœtid empyema is then reported in which the patient died of cardiac failure six days after the operation. No rib was resected, and no washing out practised, and yet the empyema cavity has contracted so as to hold not more than 30 c.c. Fine pleuritic adhesions were found all over the rest of the lung. No cause for the fœtid character of the empyema could be found. There was dilatation of the heart, and marked fatty degeneration of its substance. This case shows that fœtid empyema may be cured by simple incision. It is not by the formation of granulations nor yet of masses of lymph, that recovery is brought about, but by the formation of these adhesions.—*Brit. Med. Jonr.*

CONVULSIONS IN CHILDREN.

Safe rule in all cases to see that stomach and alimentary canals are emptied. For this, give a full dose of ipecac, repeating in ten minutes if necessary. If this fails to bring on vomiting, tickle the fauces till successful. Give a copious enema and follow with a half-ounce dose of castor oil. After purging, give chloral till relief is obtained. For a child two years of age, ten grains in a little water can be given per rectum. A child one year of age will stand half the quantity. Morphine may be used if the convulsions are due to uremia. If scarlet fever or measels is coming on do not purge too freely, as it delays eruption. The popular hot bath should be used with caution. If the cause of the convulsions is the advent of an infectious disease it may do good, as it brings the blood to the surface of body and relieves internal congestion. If the convulsions are due to central lesions, when treatment is of no avail the hot bath may possibly be used for the consolation of the patients.—*Ex.*

ON THE TREATMENT OF CROUP.

Pilière read a paper on this subject before the Paris Academy of Medicine. After the year 1880, said the author, he treated with the greatest possible success all the diphtheritic forms of the disease in the following manner:

He washed out the pharynx morning and evening with a cotton brush dipped into a solution of nitrate of silver of 1:30 strength, detaching as much as possible of the false membrane. After each washing he atomized a solution of corrosive sublimate into the throat, using in cases of children above two years old 1:500 solution, and below that age 1:1000, These pulverizations of the corrosive solution have been repeated every two hours during the day and every three hours during the night. Never in his hands has any accident or mercurial poisoning been constant or fatal.—*Le Scalpel.*

DIPHTHERIA AND MEMBRANOUS PHARYNGITIS.

Diphtheria.	Membranous Pharyngitis.
1. It is not common after puberty.	1. It is most common after puberty: not often met with in young children. Mackenzie says tonsillitis is more common between fifteen and twenty-five than any other age.
2. The prostration and sense of illness is marked, although the temperature be little elevated and the throat symptoms slight. Briefly, general symptoms more marked than local.	2. The prostration and sense of illness is usually not marked, although the temperature be very high and the throat symptoms severe. Briefly, the local symptoms are more marked than the general.
3. Albuminuria is common.	3. Albuminuria is very exceptional.
4. The edges of membrane are thin and ill defined, and shade off into surrounding tissue. on peeling membrane a bleeding surface is left.	4. The edges of membrane are steep and well defined, terminating abruptly. On peeling membrane no bleeding or excoriation.
5. Uvula commonly involved.	5. Uvula rarely, but may be involved.
6. Membrane does not dip into follicles. (Flint.)	6. Membrane may be seen dipping into follicles. (Flint.)
7. No follicular ulceration co-existent. (Schech)	7. Follicular ulceration present frequently. (Schech.)
8. The tongue at outset is not usually characteristic.	8. The tongue at outset is frequently characteristically coated with thick yellow-white fur.

THE INFLUENCE OF THE MIND ON THE BODY.

In an article entitled "Psycho-Therapeutics," which Wm. Dale, M. D., of London, contributes to the *London Lancet*, he presents many interesting suggestions.

Fear, anger, revenge, grief, love, hope, joy, friendship, may all effect physical condition.

As illustrative of the belief in this theory, so early a writer as Churchill says:

> The safest way to health, say what you will,
> Is, never to suppose we shall be ill;
> Most of the ill that we poor mortals know,
> From doctors and imagination flow.

The efficacy of strong emotion in producing, or in helping to produce, such conditions as diabetes, chorea, and epilepsy, is well recognized, and, we venture to say, undoubted; but it is always difficult to estimate correctly the influence of such accidents, or to say how much may be due to them and how much to an underlying instability which such a disturbance merely makes evident. That a depressed physical and mental condition also renders the bodily organs more susceptible to the influence of some poison, such as that of the specific fevers, is well recognized; and when the inseparable connection between mind and body, and the profound alterations which fear or joy bring about in (for example) secretory organs, are taken into account, it is not surprising that violent emotion should, as it were, open the gate to allow the admission of sundry toxic influences.

It is an interesting question how much of the general—but by no means invariable—immunity which medical men enjoy from infectious disease is due to the calmness and unconcern with which they regard such disease in relation to themselves. They forget to be afraid, and so they are clothed with an invisible and often an invulnerable cloak.

It appears, then, that Faith and Hope are the two great principles which the physician must encourage to seek to evoke in his patient. The disease to which man is liable may be looked upon as so many enemies which lay siege to the citadel of his life, and often he is so fiercely assailed by them that he finds no help or defense in himself; and it is then that the physician, coming to his rescue with the powerful allies Faith and Hope, may perchance create within him a courage which will enable him to make, at least, a brave stand against his foes.

DIET IN DIABETES.

The following rigorous diet is recommended by Dujardin Beaumetz of Paris: Eggs, fish, meats of all kinds, poultry, game, oysters, fish and cheese.

All green vegetables are permitted except beets, carrots and beans.

Fatty foods are recommended, such as sardines in oil, herring, lard, goose-grease, ham-fat and caviar.

All soups are permitted, when made of meats in combination with cabbage, poached eggs and onions. Put no bread or toast in the soup.

Only dietic breads are to be used and saccharine in place of sugar.

All starch foods are strictly forbidden, as sweet fruits, pastries and chocolates.

Patients may drink claret wine diluted with Vichy, but no poor wines, liquors or spirits.

Daily exercise morning and evening in open air; fencing and gardening and other light exercise.—*Medical Mirror.*

VALVULAR LESIONS OF THE HEART AND PULMONARY TUBERCULOSIS.

Lannois (*Revue de Médecine*, 1892. No. 10, p. 830), calls attention to the infrequency of the association of valvular disease of the heart and pulmonary tuberculosis in the same person, and reports an illustrative case. A blacksmith, thirty-nine years old, had had an attack of enteric fever at the age of five, followed by convulsions; at seventeen, an attack of acute articular rheumatism, with pericarditis; at twenty-three, a second attack of rheumatism, with endo-pericarditis; three years later, a third attack; and three years later, a fourth attack. From the age of eighteen years he had had a winter cough. Following the last attack of rheumatism the appetite had failed, strength and flesh had been lost, and albumin had appeared in the urine. The respiratory murmur became enfeebled below the clavicles; sonorous râles were heard posteriorly and at the bases, while the cough developed sibilant râles. The patient became ill at ease, felt slightly feverish, and took to bed. It was found that the temperature was 105°. Oppression of the chest set in. The sputum became nummular. Sibilant and subcrepitant râles were to be heard. The number of respirations was increased. Dyspnœa became marked and aphonia appeared. The patient grew progressively worse and finally succumbed. At the

post-mortem examination the right pleural cavity was found obliterated by adhesions. Both lungs were congested. Beneath the pleura numerous gray granulations were visible, while the anterior margins of the lungs were emphysematous. On section, granulations, some of which were caseous, were found throughout both lungs, but in greatest number at the apices. The glands at the hilus of the lung were enlarged, but not caseous. The kidneys contained numerous miliary tubercles. The spleen was enlarged, the liver fatty. The heart was bound to the pericardium by old adhesions. Neither the organ nor its serous sac presented evidence of tuberculosis. Both the aortic and the mitral leaflets were thickened and the two valves were manifestly incompetent.—*Amer. Jour. Med. Sci.*

PRIMARY CARCINOMA OF THE COMMON BILE DUCT.

May (*Münch. med. Woch* , August 16th, 1892) reports the following case in a man aged 67: who was said to have suffered formerly from renal colic. In the winter of 1890 he had influenza, and since then cough and dyspnœa. There were no hepatic symptoms, and he had never had jaundice. About six months later he had symptoms which were apparently due to myocarditis and cardiac dilatation. The liver was then noted as enlarged. In January, 1891, he lost his appetite and began to waste considerably. Jaundice, which had been present for a short time, became intense. It was often thought that this was the result of something more than mere back pressure, but the supposition could not be proved. Later there was general dropsy. In February, 1892, he was suddenly seized with intense pain in the right hydochondrium and vomiting. He died of collapse in two days. The heart was found to be enlarged and dilated, and the substance degenerate. There was suppurative peritonitis. There were a few small stones in the gall bladder, the walls of which were perforated in the one place. Similar stones were found in greater numbers in the cystic duct, and also in the much-dilated common bile duct. At the opening of the latter into the intestine there was an annular mass of new growth, which partly projected into the lumen of the gut. The liver was enlarged, of a dark green color, and contained secondary deposits of columnar carcinoma. Schüppel says that the characteristic symptoms of this disease are steadily increasing jaundice, showing no improvement, along with symptoms of biliary stasis and hepatic enlargement, but that often the diagnosis is almost impossible. The disease here lasted apparently about a year. Most of the recorded cases have died of pneumonia. It would appear from this case that gall stones play a part in producing carcinoma. Of nine reported cases, however, gall stones were only present in one, and then they were still in the gall bladder. The author calls attention to the well-marked but passing benefit to the appetite produced by orexin in this case.

ITCHING IN SCARLET FEVERS.

This is not always agreeable, but it has never been supposed to be a favorable sign, yet St. Phillippe (Rev. Mens. de Mal de Lienf., February, 1890) presents the fololwing conclusions:

(1) Scarlatina is a disease which is often accompanied by itching. (2) This variety usually has a favorable prognosis. (3) The itching is due to the fact that the eruption is not intense and the cutaneous lesions not very profound.

A good application for the relief of this itching is the following:

℞ Campho-phenique..... ʒ ss
Albolene unguent..... ʒ ss.

M. Sig.: Apply night and morning.

Another advantage is that it is in the direction of personal disinfection.—*Archives of Pædiatrics.*

SURGERY.

THE RADICAL CURE OF INGUINAL HERNIA IN YOUNG INFANTS.

Until quite recently the general teaching of systematic writers on the subject has been adverse to operating for the radical cure of hernia in very young children. Berger, for instance, basing his opinion upon the frequency of cure by the bandage, deprecated operation upon such subjects. More recent writers, however, have brought forward evidence to justify this operation without reference to the age of the child. Félizet, in his thesis (1891), has reported a successful double operation

upon a child of eight months, the interference being necessitated by the enormous size of the hernial tumors. Broca (*Revue mens. des Maladies de l' Enfance*, April, 1892) does not hesitate to operate after the age of three years, and his seven observations show that the operation itself is not a grave one, and its results can be compared to those obtained in adults. Below the age of two years he does not think operation is justifiable, because the phenomena of strangulation are never grave, and, moreover, antisepsis is difficult to maintain. Karewski (*Berliner klinische Wochenschrift,* March 18, 1891), however, thinks that scrotal hernias can be radically treated without danger, even in infants of the tenderest age. Of the nine children upon whom he thus operated, the youngest was nine months and the oldest two years and three months. In none of these case did relapse occur, and all recovered without accident. The most recent report of cases comes from Phocas, of Lille (*Le Mercredi, Médical*, 1892, No. 29, p. 341), who gives the notes of two operations, one upon a child of fifteen months, the other upon an infant of four months, both of which gave eminently successful results. This author puts himself in line with the operators already quoted; but he is disposed to believe the conditions changed when the radical operation is practised as the termination of a kelotomy for strangulated hernia, for in this case the tissues are infected and the child in a depressed state; and he considers these facts as warrant for refraining from operation in case of strangulatlon in children under two years of age. Such a decision, moreover, seems justified by the fact, noted by all observers, that strangulation at this age is a relatively benign accident. In many cases simple taxis is sufficient, and sometimes the condition yields spontaneously. Nevertheless the diagnosis of strangulation is surrrounded by so many difficulties in these very young subjects, that statistics have little weight. On the other hand, the existence of a hernia, which cannot be satisfactorily controlled by any of the palliative means, is a source of so much annoyance and suffering to the infant that measures for radical relief are, in many cases, peremptorily demanded. The operation promises better success, of course, when practised in the absence of strangulation, and the author would not hesitate to reduce a strangulated hernia by taxis, waiting for a more favorable time to attempt the radical cure. As a general rule he believes it to be sufficient to extirpate the peritoneo-vaginal canal, whose abnormal persistence is the sole cause of this hernial defect.—*Amer. Jour. Med. Sci.*

TREPHINING FOR RELIEF OF INTRACRANIAL PRESSURE.

That in cases in which an intracranial growth is present much relief is at times given by trephining is now well known, but the number of cases as yet reported is too small to allow of its being recognized as a certain, and at the same time, a safe means of treatment. Such treatment, of course, is only applicable to cases in which either the new growth is too large for removal, or its locality cannot be definitely diagnosed. As regards growth in the cerebellum, clinical observation is still at fault. While in some cases it may enable us to say with a fair amount of definiteness that there is a cerebellar tumor, in very few can it be predicated on which side of the cerebellum the growth lies. Every recorded case, therefore, is of extreme importance, as enabling a judgment to be formed of the difficulties and drawbacks which follow such an operation, as well as of the relief experienced and the nature of the cases in which the operation may be expected to have a favorable result. In the *Journal of Nervous and Mental Diseases*, Dr. Knapp, of Boston, reports a case in which diagnosis was very difficult, and in which an operation was undertaken chiefly for the purpose of relieving symptoms resulting from increased intracranial pressure. The patient had been fairly well till October, 1889. He then began to suffer from occasional severe headaches, and at times dimness of sight. He was seen at this time to have double optic neuritis. He lost the sense of smell early in the illness, and became totally blind in August, 1890; but on one occasion, after a severe attack of vomiting, he is said to have had a temporary return of vision. He was seen by Dr. Knapp in October, 1890, and then he had for three weeks complained of failure of hearing in the left ear, had experienced some difficulty in swallowing, and there was a profuse flow of saliva. He had also had on two occasions attacks in which he cried

out, fell down, and frothed at the mouth. He likewise had sensations of numbness of the face and hands, but tactile sensibility was fairly good. He suffered from headaches, and was restless and slept badly. There was pain on pressure on a spot in the right temple. Sometimes neither knee-jerk could be obtained; at other times only the right was present. Trephining was advised, and was performed on Jan. 18th, 1891. Bone was removed in the right parietal region, just behind the anterior end of the fissue of Sylvius. There was bulging at the opening; but no tumor was felt or seen even after the opening had been considerably enlarged. After the operation he was more comfortable, although not quite free from headache, and at his own request he returned home on Jan 28th. He returned a few days later, apparently suffering from left hemiplegia and hemianæthesia, and he remained in a very solmnolent condition of some days. There was oozing of blood from the posterior end of the incision which had apparently broken down, and later on some brain substance came away On Feb. 14th he became almost comatose but a profuse watery discharge from the wound set in, and he began to improve There was no change in the condition of the hemiplegia, or any sign of returning vision, but his mind was much clearer The hernia, however continued to slough, and on March 7th he suddenly became worse, and died on the 9th. At the necropsy there was found signs of meningitis around the trephine opening, and a large tubercular tumor in the left lateral lobe of the cerebellum. Of course, in such a case operation was a forlorn hope, for there was little probability that even vision could have been to any extent restored, and it was also a misfortune that breaking down of the scar should have occurred with the consequent hernia cerebri; but the temporary relief from pain, although brief, is significant.—*Lancet.*

FIXATION OF CATHETERS.

Pilz, of Vienna, describes an ingenious and apparently efficient way of fastening catheters used for continued drainage of the bladder when passed per urethram. It consists of inserting the catheter in the usual manner so that the "eye" is just inside the internal sphincter; the catheter is then transfixed with a pin at its point of emergence from the meatus, which prevents its entering farther into the bladder. It is kept from slipping out of the urethra by a strip of adhesive plaster passed over the pin and the ends fastened to the dorsal and ventral surface of the penis. These latter are prevented from slipping by other strips circularly applied, which also, it is claimed, prevent erection. Lauenstein, in cases of perineal section, fixes the catheter by a ligature passed through it through the perineal wound. The ends of this ligature are then tied over the iodoform gauze tampon which lies in the perineal wound, and thus fixes the catheter.—*West. Med. Rep.*

USE OF NITRATE OF SILVER IN URETHRAL INFLAMMATIONS.

Dr. R. Guitéras (*Journal of Cutaneous and Venereal Diseases*) says:

Nitrate of silver is not dangerous in acute urethral inflammations as is generally supposed.

By beginning with small doses and increasing daily a tolerance can be established (the same as in chronic cases).

Although a solution of the strength of 15 or 20 grains to the ounce can be reached in this way, it is not wise to go above 8 or 10 grains; and then if the result is not favorable to continue with some other means.

In this, as in bichloride irrigations, and all other methods which try to cure this trouble quickly, a dry, congested and slightly irritated condition is liable to follow, which should be treated for some days by mild astringents, these to be left off gradually.

When the discharge becomes very slight, it is better at times to decrease the strength of the arg. nit. than to increase it.

In cases of gonorrhœal cystitis, which are usually acute, good results are obtained by instillations of this drug.

In cases of chronic deep urethral inflammations, especially those of a granular nature, deep urethral injections are the remedy *par excellence.*

Nitrate of silver as an abortive should not be used, as in doing this peri-urethral inflammations may be set up, which might cause considerable trouble.

ISOLATED HERNIA AND STRANGULATION OF THE APPENDIX VERMIFORMIS.

Thiéry (*Bull. de la Soc. Anat. de Paris*, July, 1892) reports a very rare, if not unique, case of isolated hernia of the vermiformis. A man, aged 58, came under the care of M. Verneuil with a very large, tense, and painful swelling in the left groin. This swelling had been noticed for eight months, but could always be readily reduced until three days previously, when in a brisk movement the man was suddenly seized with pain in the affected inguinal region. Subsequently he vomited frequently, but up to the time of admission his bowels had been frequently relieved, and gas could be passed by the anus. On incision of the inguinal swelling, which resembled in every respect a strangulated hernia, it was found to be made up of numerous layers of brownish, infiltrated and friable tissue. At the bottom of this thick mass a small cavity was opened, which contained a small quantity of fluid with a strong fæcal odour. On opening up this cavity which proved to be a narrow peritoneal sac, a gangrenous cord was exposed, which, after section of the constricting neck of the sac, was traced upwards and found to be the distal portion of the appendix vermiformis, measuring about 8 inches in length. This had been tightly strangulated at the junction of the inferior with the middle third. It was gangrenous below the constriction and perforated at its extremity. A ligature was put around the appendix close to the cæcum, and nearly the whole of the process was removed. The infiltrated structures forming the bulk of the inguinal tumour were carefully dissected away. The patient made a good recovery. —*British Medical Journal.*

THE RESULTS OF 572 TRACHEOTOMIES FOR DIPHTHERIA.

Habs (*Deutsche Zeitschr. f. Chir.*, Band xxxiii., Heft 6) reports 572 cases of tracheotomy for diphtheria, with 316 deaths, or a mortality of 55¼ per cent., extending over a period of six years, and showing a decrease of nine per cent. between the first and last periods of three years each. The operation was most seldom performed in April, May, June, July, and August, and during these months the percentage of mortality was likewise the least. It increased gradually from that time, reaching its maximum in March, then decreasing. The average length of treatment was sixteen to twenty days. The most children died in the first five days after the operation, nearly as many dying on the fourth day as on the day of operation; then the danger decreases till the eighth or ninth day, when pneumonia is to be feared as a cause of death. A relatively good prognosis can therefore be given in those cases in which the patient passes the fifth day, except where intercurrent complications appear. The best cases are those in which, after the operation, the breathing is free, no membranes are found, the pulse good, fever slight, and little albumin is present in the urine; while those cases are unpromising in which the breathing is not free, where slight retraction of the chest walls continues, and deep-seated membranes or a tendency to pneumonia are present—yet they are not hopeless, and, on the other hand, even in the most hopeful cases there are the secondary sequelæ to be feared.

The mortality is very high in the first two years of life, then falls, rising again during the sixth and ninth years to forty per cent., and after the tenth rising again to fifty-nine per cent.; this is to be accounted for by the severe type that attacks older children. There is a greater percentage of deaths among male children than among female, and also more males are attacked by the disease.

[These results, which seem to show a percentage of recoveries of 44¾ per cent., are more favorable than are usually obtained in this country, where I believe the the figures show 28 to 33 per cent. of successes. It is probable that H.'s cases were operated upon at a very early stage, as hospital patients abroad usually submit more promptly and unquestioningly to surgical measures than in America.—J. W. W.]—*Amer. Jr. Med. Sci.*

PROSTATECTOMY.

The following new method in prostatectomy is described by Tobin (*Medical Press*, September 21, 1892). After supra-pubic cystotomy has been performed, and the diagnosis of enlarged prostate confirmed, a straight urethral écraseur is passed *per urethram* until the point touches the pros-

tate at the level at which it is desired to operate; the wire loop is then opened and made to encircle the portion to be removed, an incision being made with scissors if required; the loop is then kept imbedded by two fingers passed through the abdominal wound, and, guided by them and the écraseur, cuts in the plane desired. The lateral lobes may be removed in like manner, incisions being made if required for the passage of the loop. The author claims the following advantages for this method: "1. As much of the gland as interferes with the escape of urine is removed, and no more. 2. Such portion is removed in a satisfactory manner, for the wire cuts up to the portion where the instrument has been stopped by the obstruction. 3. A smooth surface sloping into the urethra is left, instead of the more or less rough one that must result from taking away the gland piecemeal with a forceps. 4. There is very little hemorrhage." He also recommends the Trendelenburg position, and reports a case of recovery with perfect function in the sphincter, and no re-obstruction after six months.

OBSTETRICS.

CONVULSIONS AT SIXTH MONTH: NO PREMATURE LABOR.

Puech *Nouv. Montpellier Mèd.*, No. 31, 1892) attended a primipara, aged 23, who was admitted into hospital for severe eclampsia during the sixth month of pregnancy. There seemed no tendency to delivery. She was at once placed under chloroform for three hours, but every time the administration was slackened convulsive movements began. Afterwards a severe convulsion set in, followed by coma. As insensibility became profound, free venesection from the arm was practiced; at once the patient's condition improved, respiration became less embarrassed, and the temperature fell from 103.6° to 101°F. an hour after the bleeding. Chloral was given, and the patient steadily improved. Albumen, which at first abounded in the urine, at length almost disappeared, the patient completely regained her senses, and the fœtal heart sounds were found to be still audible. When the report was published, there seemed every chance that the patient would continue her pregnancy to term.

THE MORPHOLOGY OF BREAST MILK AND THE NUTRITION OF THE CHILD.

An extensive study by Ivanhoff (*Thése de St. Petersburg, 1890*) of this subject led him to the following conclusions.

1. The cellules of colostrum are of epithelial origin.
2. The multiparæ colostrum changes to milk more rapidly than in primiparæ.
3. Puerperal diseases retard the disappearance of the colostrum corpuscles.
4. These corpuscles reappear in the milk after ten months of lactation, and when the infant is only partly fed from the breast.
5. The free hyaline corpuscles, as well as those which are enclosed in the fatty globules, form a constituent of normal milk at a certain period of secretion.
6. Good health, good nutrition, and youth in the mother give a milk richest in fatty globules of large size, as is also true of the cellules.
7. The last portion of milk taken at a feeding holds fewer globules, and these of smaller size than the first portions.
8. The estimation of the nutritive quality of milk should be based upon the number of fatty globules; and, secondarily, upon their size, the quantity of cellular element, and, finally, upon the quantity of granules.
9. Milk which contains a very large number of fatty globules (more than 3½ per cent.) is not well borne by very young infants.
10. Milk, the globules of which are large, is less nutritive and less well borne.
11. The maximum of daily increase of weight of the child is produced by milk which contains a mean quantity of fatty globules of medium size (27.7 grammes daily).
12. The milk which contains few fatty globules gives little increase of weight (16 grammes daily); and the same is true if the fatty globules are in too great quantity or are too large (19 grammes daily).
13. Women who are thin and young in general are the poorest nurses, often making the children dyspeptic and giving them a mean daily increase of weight of only 11.5 grammes.
14. The microscopic examination of a freshly secreted milk gives a sure indication of its nutritive value.

FEVER IN RECENTLY DELIVERED WOMEN.

Crouzat (*Midi Mèd.*, July 9th) strongly advocates the popularisation and general diffusion of complete antisepsis from the first in all labors, however simple; otherwise a strong, healthy young woman may often be lost, and for such a loss the obstetrician or midwife is responsible. Crouzat describes a sad case of this kind. The patient, aged 26, was naturally delivered on the night of May 29th; the placenta came away entire, and she did well till the second day, when rigors and fever set in. The abdomen became distended. The blood drawn from the patient's finger was full of streptococci, and set up erysipelas when inoculated into a rabbit's ear. The patient died on June 6th. The uterus was fixed by solid inflammatory deposit which filled the fornices. The public and the profession must understand that "milk fever" does not exist. A rise of temperature of over 100° in a patient delivered within two or three days should at once awaken suspicion of puerperal infection, and rigorous antiseptic treatment will at once be needed. Yet, with the greatest skill and care, the patient may be lost. Hence it is the duty of the obstetrician to prevent any chance of such rises of temperature by taking strict antiseptic precautions in the conduct of all cases of labor.

MISSED ABORTION: OVUM RETAINED ELEVEN MONTHS.

Budin (*Nouv. Arch. d'Obstét. et. de. Gynéc.*, October, 1892), read this case at a meeting of the Obstetrical Society of Paris in July. The patient, aged 24, was a married Russian medical student. The last period, very profuse, was seen at the end of June, 1891, then her first pregnancy began. Morning sickness was severe. Early in November, when starting for France, she was upset out of her carriage into a river. She felt no shock, and continued her journey. At Berlin, pains set in, with "show." When she reached Paris the symptoms of miscarriage increased. After fifteen days' rest she got up. Slight hæmorrhage became almost constant. On March 28th, 1892, Budin examined her, and diagnosed retention of the dead ovum. The patient was watched; on June 14th a gum catheter was passed into the uterus. Contractions were set up next day by the introduction of a pig's bladder into the vagina, gradually distended with water, and held in place against the upper limits of the vagina by an air pessary. Pains set in, followed by great excitement, and then lethargy. The bladder was therefore removed four and a half hours after its introduction. Injections of sublimate were thrown up, uterine contractions became severe, then the alarming symptoms recurred. Some old decomposed clots came away, and early next morning a great fleshy mass was expelled. A rigor followed, but thenceforward the patient did well. The fleshy mass was the ovum long blighted by hæmorrhage. The fœtus had been completely destroyed. Amniotic and placental tissues were detected by microscopic examination.

GYNECOLOGY.

PRIMARY CANCER OF LABIUM.

Zeiss, of Erfurt (*Centralbl. f. Gynäk.*, No. 40, 1892) was consulted in 1887 by a robust woman, aged 38, the mother of three children. She had noticed a small tumor in the external parts for four or five months. For four weeks it had caused pain. It formed a swelling of the size of a hazel nut in the posterior part of the right labium minus; its inner aspect was ulcerated. The inguinal glands were not involved. Zeiss carefully amputated the entire labium with Paquelin's cautery. The microscope proved that the growth was cancerous. In 1889 she became pregnant, 1890, she bore a child, and when suckling it, a swelling developed in the left breast. It slowly grew, and in the summer of this year began to be the seat of lancinating pains, most marked in bad weather or during menstruation. In February, 1892, irregular flooding began. In August, exactly five years after the removal of the labial cancer, Zeiss examined her once more. She was very much emaciated. The cervix was partly destroyed by a large excavated cancer, the uterus could not be removed. The inguinal glands were not involved, the scar of the old operation wound on the site of the labium was healthy. The left breast was the seat of scirrhus with retracted nipple, and two axillary glands were enlarged. There was no evidence of metastatic deposit in the viscera.

A CASE OF VAGINISMUS.

About five months ago Mrs. N. M— called upon me, from New Jersey, with the following history: She had been married five months, had always enjoyed perfect health, although she was of a somewhat nervous disposition and anæmic. Quite soon after her marriage coition had become impossible. The accompanying pains were something intolerable at first, making, as stated, coition entirely impossible. There was no discharge, no leucorrhœa: defecation and urination were without pain and regular; appetite good.

Upon my request that a thorough examination of the parts locally would be necessary, she gladly consented, but doubted the possibility of a digital examination. As she lay upon my operating table, inspection showed nothing but a slight œdema and redness of the external parts. Upon my attempt to introduce my index finger, the muscles of the floor of the pelvis became suddenly perfectly rigid, the muscles of the thighs began to contract spasmodically, the patient cried and complained that I was causing her the most agonizing pain. No amount of persuasion could induce her to become quiet or calm, and as she became more and more hysterical I was compelled to desist from all further examination.

I had not even been able to separate the labia, nor had I been able to see the hymen, or what was behind it.

A second examination, a week after, was even less successful than the first. The pains had grown more intense, the parts so hyperæsthetic that even the clothes coming in contact produced great agony. Her condition was deplorable, and her marriage life was far from being a happy one.

There was no doubt that the existing symptoms were those of vaginismus, the cause of which I had not as yet been able to detect. Consequently it was considered best to anæsthetize her and act at once according to the existing lesions.

When perfectly under its influence, and the parts had thoroughly relaxed, my finger entered the introitus vaginæ without the least resistance. The uterus and vagina were explored, but nothing abnormal could be detected.

Nevertheless, a close ocular inspection revealed the following conditions: The hymen had been lacerated into four distinct parts, each of which was more or less triangular in form. On the apices of each of these a small hypertrophic nodular mass (like corns on the feet), of the most extreme sensitiveness, was detected. Naturally I resorted at once to the excision of the entire hymen. There was but little hæmorrhage; the resulting raw surface was left to cicatrize. A tampon of unguentum iodoformi was inserted into the vagina, large enough to distend the entire cavity thoroughly. Calling upon my patient the next day, I could realize at once the success of my operation as experienced by her countenance.

She could change the tampons and irrigate the parts with but little annoyance, except, as she states, a feeling of slight soreness. The introduction of tampons was continued for about ten days longer. The small wounds healed admirably. There was no more pain. She is now pregnant.

RUPTURED TUBAL PREGNANCY.

Mersch (*Centralbl. f. Gynäk.*, No. 44, 1892) not long ago exhibited a most instructive specimen before the Obstetrical Society of St. Petersburg. It was a tubal pregnancy discovered at a necropsy on a woman who had died of phthisis. The tubal sac had burst. The skeleton of the fœtus was found strongly adherent to the lower end of the mesentery. The soft parts had been almost completely absorbed. The entire process must have caused but little general disturbance, for there was no history of any serious illness excepting pulmonary disease.

NEWS AND MISCELLANY.

THE DISEASE OF INEBRIETY.

Statistics of persons arrested for inebriety, extending over long periods, will point to certain years in which a maximum in numbers was reached, followed by a retrograde movement back to minimum. This tide-like movement is sometimes clear, then obscure. Often it is marked by both epidemic and endemic waves, and is traced in the prevalence of inebriety in towns and cities, and in the reaction noted by temperance revivals. This psychologi-

cal ebb and flow was pointed out by Dr. Westphal in Sweden many years ago, and an interval of seventeen years was indicated as the time between the maximum and minimum periods of inebriety in that country. Shorter periods have been noted by other observers in different countries. Many very startling facts point to this wonderful cycle and drink orbit, and help to explain the strange temperance revivals which spring up and sweep over the country, dying away with the same mystery and suddenness. Such movements are undoubtedly the backward swing of high tides of inebriety. The histories of large cities and towns supply many startling confirmatory facts of periods of inebriety and intense temperance revivals following each other with a strange, fascinating mystery. Like the ebb and flow in politics, religion and the great social movements, these drink cycles or waves point to ranges of causes and conditions awaiting future discovery. While many of the causes of inebriety as seen in the individual are both preventable and curable, there are other unknown psychological and physical forces that control the form and direction of the inebriety of both sexes. Whatever inebriety is in Europe, or may have been in the past, it is in this country a brain and nerve disease, marked by mental and physical failure, exhaustion and central degeneration.—*T. D. Crothers, M. D., in North American Review.*

EVIL LITERATURE.

Bad readings do an immense amount of harm to the young, who are given to imitate these heroes of fiction or of theatre, above all whenever the publication or drama presents vice under attractive colors. Children cannot without danger read, nor see, nor hear everything; ignorance of evil is the best safeguard of a child's morality. The automation which is in each one of us, according to the deep observation of Pascal, is particularly inclined in childhood to reproduce acts the portrayal of which provokes emotion. That is why Plato did not believe that all sorts of fables indifferently could be told to children, and considered as detrimental to morality the tales of criminal deeds which the poets ascribed to the gods. The souls of youth, as their bodies, require a pure atmosphere, amid which they may develop in kindness, purity and courage.

The physicians and criminalists who understand the power of good and bad example would—with propriety — prohibit the press from parading in the newspapers the unhealthy outbreaks of society's moral infirmities, of its suicides and crimes; they fear, with cause, the effect of this publicity on the weak and sickly minds (for all the insane are not in the asylums), on the young men and nervous women. The details furnished upon the execution of suicides and crimes generally strike the mind and may awaken a spirit of imitation. This publicity, moreover, presents the very grave inconvenience of teaching the details of execution of criminal acts.—Translation from Louis Proal, in *The Summary.*

THE TREATMENT OF DELIRIUM TREMENS.

The author asked first, What was delirium tremens? Was it a morbid state, which was the issue of neurasthenia, or was it an effect of alcoholic poisoning? He believed it to be the latter, and that the disease arose from the cumulative specific action of the poison of the cerebral tissues through the alcoholization of the blood. Acting on this theory, he had aimed at eliminating the poison from the brain and nervous system, leaving the healing power of nature to do the rest. This was the view taken in 1854 by Dr. Alexander Peddie, who administered antimony. Dr. Kerr, however, has found liquor ammonii acetatis to satisfactorily fulfil the conditions most favorable to cure. The main point was to avoid the use of alcohol and opiates, chloral, and all narcotics. The best hope of cure lay in natural exhaustion inducing sound, refreshing sleep.

The differing results of narcotic and non-narcotic treatment were exemplified in the case of a publican, who, in his second attack, was treated with opium and bromides, and in his third attack only with liquor ammonii acetatis. In the former seizure the patient, aged 48, even after sleep, was so heavy, unrefreshed, and then violent, that it took four men to hold him. To save his life he had to be put

into a padded room in the work-house, where he raved till exhausted and procured sleep, his only beverage there being coffee. In the latter seizure, two years afterwards, he was treated at home, the only medicine being liquor ammonii acetatis, at first in drachm doses every hour; milk, beef-juice, broth, and coffee were given frequently. In about seventy hours he had a sound sleep for four hours, followed in four hours more by a spell of twenty hours' sleep. The latter attack was complicated with an epileptic fit. The recovery was quicker than from the previous attack. These were both typical examples of the graver form of delerium tremens. By a reliance on so safe a sudorific as liquor ammonii acetatis and suitable nourishment, we best fulfill the conditions of cure, as we hereby give the *vis medicatrix nature* a fair field and no favor. —*Thera. Gazette.*

BURNS OF THE EYES.

Dudley S. Reynolds (*Jour. Am. Med. Association*), after referring to the various substances, as quick-lime, ammonium, nitrate of silver, sulphate of copper, caustic potash, and fused metals, which may produce burns, and to the use of the chemical substances which may be utilized for neutralizing them; for instance, the free ablutions of vinegar, and followed by a weak lotion of chloride of sodium in the cause of caustic potash, condemns the practice of closing the eyes that are so affected. In his belief the use of oils, and especially castor oil, so much in favor with the profession, produces in all cases an increase of irritation. Whenever any mucous membrane is wounded, and it becomes necessary to make local applications to it, the chemical combinations of the fluid covering that membrane in its normal condition should be considered in devising the plan of treatment. Inasmuch as the conjunctiva in its normal state is constantly bathed in a fluid rich in chloride of sodium, this salt should enter into nearly all local applications designed to remove offending matters. In one case of a severe lyeburn of the eye, which had first been treated with the instillation of vinegar, Reynolds used with satisfaction the following lotion:

℞

Borate of sodium	ʒ iiss.
Chloride of sodium	ʒ ss.,
Distilled water	ʒ xii.
Camphor-water	ʒ iv.

The reporter considers that burns so extensive as to make it impossible to prevent adhesions between the lid and the ball may be greatly modified by leaving the eye open, and daily separating the opposed abraded structures with a probe annointed with a yellow oxide of mercury ointment. —*Ther. Gazette.*

The Trustees of the Methodist Episcopal Hospital, at the December meeting, elected Dr. Geo. E. deSchweintz and Dr. Alexander Randall, ophthalmologist and aurist, respectively, of the consulting staff of the Hospital.

DIPHTHERIA.

The following new combination is recommended by Ozegowski in the *Nouring Lekarskie:*

℞

Iodine Carbolic acid Citric acid	āā	3 to 5 grams.
Brandy enough to make		100 "

M. Sig: Apply on cotton compress to the diphtheritic membrane.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY FROM DECEMBER 11, 1892, TO DECEMBER 17, 1892.

Leave of absence for four months, with permission to go beyond sea, is granted Captain Peter R. Egan, Assistant Surgeon, U. S. Army.

The leave of absence granted Captain James D. Clennan, Assistant Surgeon, U. S. Army, is extended thirteen days.

Lieutenant Colonel William D. Wolverton, Deputy Surgeon-General, U. S. Army, is relieved from duty at Fort Schuyler, New York, and will report in person to the Commanding Officer, Watervliet Arsenal, West Troy, New York, for duty at that Arsenal.

Upon the recommendation of the Medical Director, Department of California, First Lieutenant Charles Wilcox, Assistant Surgeon, will report to the Commanding Officer, Presidis of San Francisco, for temporary duty at that post, until the departure from Angel Island, Cal. of Major William H. Gardner, Surgeon, when he will proceed to Angel Island, and report to the Commanding Officer of that post for temporary duty.

Leave of absence for two weeks on surgeon's certificate of disability, with permission to apply for an extension of two weeks, is hereby granted to Captain Adrian S. Polhemus, Assistant Surgeon, U. S. Army.

OFFICIAL LIST OF CHANGES OF STATIONS AND DUTIES OF MEDICAL OFFICERS OF THE U. S. MARINE HOSPITAL SERVICE FOR THE EIGHT WEEKS ENDED DECEMBER 10, 1892.

Purviance, George, Surgeon, detailed as chairman of Board to consider changes in uniform, Dec. 6, 1892.

Hutton, W. H. H., Surgeon, relieved from duty at Cape Charles Quarantine, to rejoin station, Nov. 29, 1892.

Hamilton, John B., Surgeon, granted leave of absence for six days, Nov. 18, 1892.

Sawtelle, H. W., Surgeon, granted leave of absence for seven days, Nov. 9, 1892.

Austin, H. W., Surgeon, detailed as member of Board to consider changes in uniform, Dec. 6, 1892.

Stoner, G. W., Surgeon, granted leave of absence for fourteen days, Dec. 9, 1892.

Godfrey, John, Surgeon, to proceed to the city of Mexico on special duty, Nov. 22, 1892.

Irwin, Fairfax, Surgeon, to proceed to Europe on special duty, Nov. 22, 1892.

Mead, F. W., Surgeon, detailed as recorder of Board to consider changes in uniform, Dec. 6, 1892.

Carter, H. R., Surgeon, relieved from duty at Cape Charles Quarantine to rejoin station, Oct. 20, 1892. Relieved from duty at Cincinnati, Ohio; assigned to duty at Norfolk, Va., Oct. 26, 1892.

Banks, C. E., passed Ass't. Surgeon, granted leave of absence for fifteen days, Oct. 24, 1892.

Glennan, A. H., passed Ass't. Surgeon, granted leave of absence for thirty days, Oct. 26, 1892.

Bratton, W. D., passed Ass't. Surgeon, granted leave of absence for thirty days, Nov. 10, 1892.

Cobb, J. O., passed Ass't Surgeon, granted leave of absence for sixteen days, Dec. 7, 1892.

Guiteras, G. M., passed Ass't. Surgeon, relieved from duty at Gulf Quarantine. Assigned to temporary duty at Baltimore, Md., Dec. 1, 1892.

Geddings, H. D., passed Ass't. Surgeon, to report in Washington, D. C., for special temporary duty, Nov. 30, 1892.

Hussey. S. H., Ass't. Surgeon, to proceed to South Atlantic Quarantine, for temporary duty, Oct. 26. 1892.

Perry, J. C., Ass't. Surgeon, when relieved at Norfolk, Va., to rejoin station at Mobile, Ala., Oct. 26, 1892.

Young, G. B., Ass't. Surgeon, granted leave of absence for twenty-one days, Oct. 27, 1892.

Stimpson, W. G., Ass't. Surgeon, to proceed to Baltimore, Md., for temporary duty, Dec. 5, 1892.

Gardner, C. H., Ass't. Surgeon, ordered to Portland, Or., for temporary duty, Oct. 25, 1892.

Nydegger, J. A., Ass't. Surgeon, to proceed to Gulf Quarantine for temporary duty, Dec. 1, 1892.

Strayer, Edgar, Ass't. Surgeon detailed as inspector of immigrants port at Boston, Mass., Nov. 22, 1892.

B & O'S NEW THROUGH LINE.

PREPARING FOR THE IMMENSE TRAFFIC INCIDENT TO THE WORLD'S FAIR.

The management of the Baltimore and Ohio Railroad is preparing for an immense business in 1893 while the World's Fair is open in Chicago. The terminals at Chicago are capable of accommodating a much heavier traffic than is now being done, and important changes are being arranged for the handling of very heavy freight and passenger business to the West from New York, Philadelphia and Baltimore. New equipment for largely increased passenger business and an extensive stock of freight cars have been ordered. The various roads of the system will be improved by straightened lines, reduced grades, extra side tracks, and interlocking switches. The new line between Chicago Junction and Akron has shortened the distance between Chicago and tide water twenty-five miles, and between Pittsburg and Chicago fifty-eight miles.

The distance between Chicago and Pittsburg and Chicago and Cleveland by the construction of the Akron line and the acquisition of the Pittsburg and Western line and the Valley Railroad of Ohio, is about the same as via the Lake Shore from Cleveland to Chicago, and by the Pennsylvania from Pittsburg to Chicago. The alignment is to be changed and grades reduced to a maximum of twenty-six feet. It is expected that in twelve months the old Baltimore & Ohio through line between Chicago and the Atlantic Ocean will have passed away and the new line via Pittsburg be established, with no greater grades or curvature than on any of the trunk lines.

Work has already begun east of Pittsburg to meet improvements making west of Pittsburg. These improvements will consist of additional second and third tracks, a general correction of the alignment, and completion of the double track on the Metropolitan Branch. It is expected that the new through line will be ready simultaneously with the completion of the Belt Line through the City of Baltimore, which is intended to unite the Washington Branch with the Philadelphia Division and do away with the present line via Locust Point. Forty new and powerful locomotive engines were added to the equipment during the last two months, and others are in process of construction. The permanent improvements now under way and in contemplation involve the expenditure of some five million dollars. —*Baltimore American.*

CH. MARCHAND'S

PEROXIDE OF HYDROGEN.

(MEDICINAL) H_2O_2 (ABSOLUTELY HARMLESS.)

MOST POWERFUL BACTERICIDE AND PUS DESTROYOR.
ENDORSED BY THE MEDICAL PROFESSION.
UNIFORM IN STRENGTH, PURITY AND STABILITY.
RETAINS GERMICIDAL POWER ANY LENGTH OF TIME.
USED BY THE HOSPITALS OF THE U. S. ARMY.

Send for free book of 80 pages, giving articles by the following contributors:

DR. P. GIBIER, DR. S. POTTS EAGLETON, DR. C. P. NOBLE, DR. C. A. PHILLIPS, DR. J. H. DeWOLF, DR. J. V. SHOEMAKER, DR. W. S. MULLINS, DR. C. W. AITKIN, DR. H. F. BROWNLEE, DR. J. LEWIS SMITH, DR. J. MOUNT BLEYER, DR. W. B. DEWEES, and many others.

NOTE.—Avoid substitutes—in shape of the commercial article bottled—unfit, unsafe and worthless to use as a medicine.

Ch. Marchand's Peroxide of Hydrogen (Medicinal) is sold only in 4-oz., 8-oz., and 16-oz. bottles, bearing a blue label, white letters, red and gold border, with his signature. Never sold in bulk.

PHYSICIANS WILLING TO PAY EXPRESS CHARGES WILL RECEIVE FREE SAMPLES ON APPLICATION.

PREPARED ONLY BY

Charles Marchand

Chemist and Graduate of the "Ecole Centrale des Arts et Manufactures de Paris" (France).

Laboratory, 28 Prince St., New York.

SOLD BY
LEADING DRUGGISTS.

SVAPNIA

OR

PURIFIED OPIUM

FOR PHYSICIANS USE ONLY.

Contains the Anodyne and Soporific Alkaloids, Codeia, Narceia and Morphia. Excludes the Poisonous and Convulsive Alkaloids, Thebaine, Narcotine and Papaverine.

SVAPNIA has been in steadily increasing use for over twenty years, and whenever used has given great satisfaction.

To PHYSICIANS OF REPUTE, not already acquainted with its merits, samples will be mailed on application.

SVAPNIA is made to conform to a uniform standard of Opium of Ten per cent. Morphia strength.

JOHN FARR, Manufacturing Chemist, New York.

C. N. CRITTENTON, Gen'l Agent, 115 Fulton St., N. Y

To whom all orders for samples must be addressed.

SVAPNIA IS FOR SALE BY DRUGGISTS GENERALLY.

Vaccine Matter.

For the accommodation of our Subscribers, we will supply both Bovine and Humanized Vaccine Virus.

Guaranteed to be fresh and in every respect first-class.

PRICES:

Bovine Crusts,	$1.50 each.
Bovine Points or Quills,	1 00 a dozen.
Humanized Crusts,	1.00, small.
Humanized Crusts,	2.00, large.

Nothing less than half dozen sold at these prices.

The Humanized Crusts are warranted to be from typical cases, and in every instance from healthy children, with unquestionable family histories.

Please accompany the Order with the Money.

BURN BRAE

A PRIVATE HOSPITAL

FOR MENTAL & NERVOUS DISEASES.

Founded by the late Robert A. Given, M. D., in 1859.

Extensive and beautiful grounds. Perfect privacy. A pleasant, safe and healthful home. Music, games, open-air amusements. The oldest institution of the kind in the United States. Both sexes received.

ARRANGEMENTS MADE FOR CHRONIC CASES.

Located a few miles west of Philadelphia, at Primos Station, on the P. W. & B. Railroad.

MOTIVE, PREPARATION AND RESULTS IN ABDOMINAL AND PELVIC SURGERY.

By JOSEPH PRICE, A. M., M. D.,

My motive in coming here is not so much to impart as to gain information. I know the value of contact, of close and intimate association with the zealous working men of the profession. Our talks, generally, have much that is very crude in them for which we need not pause to apologize.

There is a growing conviction in the profession that every surgeon must stand on his own legs. In medicine and surgery there are no Blue Laws—no geography fixing the limits of advances. There will always be a pressing need to make our science and art better. There is not much in that physician or surgeon who is content with his little store of scientific knowledge, with the results of his observations and experiences however extended and successful. He would serve better in redeeming some old sedge field to productive agriculture than in the field of medicine and surgery. Those men learn most who feel most the gravity of their responsibilities, the issues involved in their work; and who zealously seek through every avenue of observation, investigation and research for that knowledge and art, those combined agencies, which will make their work the more successful.

Many of our countrymen travel from the extreme borders of our forty-four commonwealths to our medicalcentres for the lessons they can gain in laboratories, hospitals, and public and private clinics. This spirit of improvement promises much for the future of medicine and surgery. It would be very discouraging to feel that our present surgery could not be out-done. The tendency is to break away from all traditions, rules-of-the-thumb maxims,—to drop all reverence for fossil immutability, for medical antiques, the bric-brac and mummies of ancestral chimney corners,—the preference is rather to do with that which is alive and promises life than with a carcass.

It is growing to be better recognized that the clearness with which the surgeon sees, the skill with which he works must come of accumulated experiences. We have a rapidly growing army of laboratory workers whose researches are making rich contributions to modern science, many of the men working with all the enthusiasm and energy of the old chemists. There is more grit and energy in the young of the profession than has ever characterized any previous period in the history of the profession. The old veterans are along with them with a youthful warmth of fellowship, and there is nerve and inspiration in their elbow touch. Wide series of researches have been called into life, directed by many along specific lines, and the more specialistic press upon our notice. These researches are evolving definite ideas from conflicting theories. So many are the kinds of work and kinds of workers that the laity are puzzled where to go and to whom with their special afflictions.

In this particular there is no very special harmony of opinion among physicians. Though a life is involved their better professional judgments are often overcrowded by personal prejudice, likes or dislikes. There is not enough of clean, clear, active working of professional conscience. There is something of appropriate illustration of this spirit in the hospital science drawn by the witty German, Henry Heine: "They remind me of a revolting quarrel, in a little hospital at Cracow, of

which I chanced to be a witness, and where it was horrible to hear how the patients mockingly reproached each other with their infirmities; how one who was wasted by consumption jeered at another who was bloated by dropsy; how one laughed at another's cancer in the nose, and this one again at his neighbor's lockjaw or squint, until at last the delirious fever-patient sprang out of bed and tore away the coverings from the wounded bodies of his companions, and nothing was to be seen but hideous misery."

Reckless ignorance, unreasoning jealousy, professional vanity, a narrow envious rivalry often goes on, insolently refusing counsel, until when the coverings are removed nothing is to be seen but hideous misery. The profession would not be impoverished by expelling all men with such low-governing motives, nor would humanity suffer.

In relation to surgery, the least experienced, the more ignorant are the ones who talk the most about the ethics of operative procedures, and even after they have failed in palliative treatment, exhausted their therapeutical resources they oppose resort to surgery. From this blindness, this narrowness, there will be an awakening. Fortunately this spirit grows beautifully less as the profession liberalizes under the influences of our advances. The notoriety of these characters renders their company of easy avoidance.

There is a certain justifiable antagonism between the honest, educated, conscientious general practitioner and the specialists of a certain class. There could not be, nor should there be, good feeling for that officious class who find fault with, and unsolicited, interfere with prescribed treatment. It is not by knowledge and skill such men sustain themselves, but by artifice, by undermining more worthy and better men. To them medicine and surgery are not learned, high-toned, dignified professions—but trades, marts, into which they can go with their wares and practice their damaging acts for the little, or much ready cash, they can command; their only credentials to recognition are their audacity and insolence.

The professional spirit of the period is not one of mimicy. It is not mortgaged to old ideas and methods. Innovations are welcomed; that only is accepted as tested truth which has withstood the severest processes of verification. We honor the man who confronts us with an honest difference of opinion; he may have much for us we need to know. I will greet him as my hero friend, if he, with his better light, will supplant my methods with his better ones, and I would have my patients send him greeting.

Both in medicine and surgery the line between enough and too much is becoming better understood. It is realized that the physician's resources are exhaustless—that they are co-extensive with the limitless field of medical science; that the highest honor of the profession is the cumulative culture, refinement and success of its individual members; that every growth and success of the individual physician is the honest advantage of all. We all must feel again and again the pain and mortification of imperfect work. We prefer to take the great workers, those working unremittingly to master the puzzling problems, as types or representatives of the best spirit of the profession.

There may be some barriers to the free use of some of our educational agencies, but they *can* and *will* be broken down. We will have more free, liberal and better teaching within the walls of our public hospitals, where ministers our public and private charities to the unfortunate victims of accident and disease; from their bedsides we *will have* the lessons that will advance our science and improve out art. We *will* batter at the doors until they *open*, or *down*, and let us in. The spirit that will gladly welcome will be substituted for the narrow and selfish one that bars us out. We are entitled to be present witnesses of those maladies with which it is our life mission to deal. There general practitioners can gain valuable lessons,—and it is in their ranks every successful specialist in the profession must have his beginning,—and there the honest, enthusiastic student of a specialism can the more thoroughly equip himself for his work.

Where the specialist in gynecology, or in any special line of surgery, attempts to give practical training it will be used against him by his professional rivals, who will try to secure patients by saying to them, "If you go to Dr. Blank he will have his students do the operation; he won't do it himself." This fact operates against practical training in private hospi-

tals. But no such excuse exists against such training in public or general hospitals. The thorough education of physicians, the health and happiness of multitudes of unfortunate human beings, demand that the lessons of the operating table and bedsides of these institutions should be the privilege of every physician and surgeon. That man does the most effective teaching who does it with his apron on. We cannot multiply to too great an extent the avenues through which we can obtain the highest education in our science, in the methods of the best surgical procedures, in the refinements of their technique. From every patient we attend there comes to us the urgent bidding, "give us the benefit of your best science, your most perfected methods for our healing."

I would press these facts home, for it is the voice of the profession that will bring about this important gain in our educational facilities. By the rights of that humanity it is our high duty to serve, I have a right to the benefit of what you know and you have a right to the lessons of my experiences, down to the simplest teachings of the cunning of my fingers.

A little aside from logical connection I would say that there is no self-mortification or shame in recognizing our individual professional limitations. When a member of my own family is sick, an early experience in general practice enables me to detect symptoms and locate the trouble, but I am prompt to call in a physician of known reputation for the treatment, an expert in the peculiar trouble, and the case is left as absolutely to him for treatment, as I insist upon in cases coming into my hands for surgical treatment. We can only stand, professionally, on the highest elevation when all the purely selfish elements are eliminated.

The inevitable risk in all cases, is that while the physician is being whirled around in a circle of doubts, symptoms are augmenting, the disease becoming more aggravated and the chances of relieving suffering and saving life growing less. Happily the profession is growing alive to these facts.

We are forced to keep in advance of the intelligence coming out from our free schools—I don't like the word common. Our clientele is demanding more and better work than was ever before demanded. Our specialisms are largely an outgrowth of this demand. In many instances the general practitioner tires of an extended and exacting practice, as he finds it wears upon his vitality. Necessity presses upon him to restrict its limits and he turns to some speciality in which his tastes and aptitudes promise success. Combining the training of his general experience with a careful and thorough training in the speciality of his selection, successful work is assured. He will hold high and honored place in his speciality—will make a record, and that not of a startling mortality. Not so with that noble possibility in embryo, the fresh graduate from our colleges, with his fashionable droop of the shoulders, bend of the elbows and knock of knees, and his one glove, who, immediately on receiving his diploma, essays to enter these fields with only his superficial theoretical knowledge, while he is scarcely prepared to do general work.

The need of the student is a hospital training, followed by dispensary practice, where he will become familiar with physical examinations and learn to recognize disease with varied forms. No one has a right to attempt the treatment of the diseases of women until he is educated to recognize and differentiate them.

Women would be better off if some of the so-called minor gynecological procedures had never been devised. Some operations and instruments in the hands of inexperienced and ill-trained hands are doing thrice more harm than good. It is alarming to note the number of serious major gynecological operations following closure or dilatation of cervix, also the inconsiderate use of the curette in the presence of advanced tubal and ovarian disease, or for the fancied existence of intra-uterine troubles, or as a therapeutic measure for a trouble lying beyond and unrecognized.

If it were possible to ascertain all the images called up to the inexperienced by the term abdominal surgery we would have a medley of conceptions as to such operations. The layman's views are very horrifying to him—to the poor woman, with whom we have to directly deal, they are not less so. We approach them, not with timidity, for that is not an element in the character of the surgeon, but with a very keen appreciation of the weighty responsibility involved, with a quick sense of the profes-

sional conscience, surgical judgment and skill needed to deal with those calamitous troubles to which women are subject. The woman, in the major cases, comes to us and uncovers "her hideous misery"—one perhaps concealed for years from a morbid sense of delicacy, or yet more likely and more frequently occurring where radical remedial treatment has been delayed through the tinkering and counsel of the attending physician. The specialist is very often her last resort. She goes to him in her desperation with her special trouble, when suffering has rendered her useless, life scarcely worth living, general health broken, weighed down by fears and many painful disappointments; with but one feeble hope clinging by delicate thread to precarious conditions. And then as she lies prostrate, disarmed, helpless, under our anæsthesia, there goes out from her a mute appeal to the highest motive that can govern in our surgery. It is, that by all the sanctities, there shall, unselfishly and devotedly, be rendered her the best service of trained judgments and skilled hands.

To be fit for this work the surgeon should clearly recognize the possible complex conditions lying concealed. His understanding of the organism of the parts with which he deals and their functions should be as nearly perfect as lies within human limitations, and this is possible only to the one who patiently investigates until he finds the truth. The great old scientist, Agassiz, could by a bone, detect a fish belonging to an extinct species; his thorough knowledge of the organic structure enabled him to know the parts.

In abdominal surgery, in fact in all surgery, there are important requirements and conditions auxiliary to judicious surgical treatment and success. The utmost care should be exercised in making all the patients' surroundings, in minutest detail, the very best. There should be cleanliness from the cellar floors to the escape pipe in the roof. There is no chemistry that will prevail against uncleanliness and slovenliness either in person or surroundings. Cleanliness, ventilation and dryness are the proper deoderizers of houses. The best precaution against all forms of dirt and dust collection is water, soap, brush, will and muscle. Their free and unremitting use, are the sure antiseptic against filth infections. Impure water is a sure conveyance of infectious poisons into the human body. All about there should be an atmosphere of purity, simplicity and cheerfulness. There is something very depressing, even to the well and healthy, in the gloom of surroundings. These sanitary and other precautions will not be carried out except under the most rigid surveillance of the surgeon himself. I presume I am not as well up in the Bible as my friends of Missouri and Kansas, but I thoroughly believe, indeed, know that the truth of the scriptural injunction, "Cleanliness is next to Godliness," is confirmed by the logic of every surgeon's experience. We insist upon the perfection of arrangements of sewerage, and scavenage, and a pure water supply for the prevention of filth diseases, while we often have offensive matter on or about our persons which water, soap and brush would remove. I would start with cleanliness, keep it up and end with it in my practice in obstetrics and in your practice. My practice in surgery and your practice, general or special, is worse than useless without it.

It is difficult to impress upon local sanitary authorities the terrible consequences of filth infections. It is sometimes only the noise of the dead carts and the activity of undertakers that awakes them to activity. It is only when filth diseases become mythically epidemic that they so far forget their despicable local politics as to pay attention to those sanitary matters which concern the welfare of the entire community in which they live and of which they are part. The continuous inflow into office receives more attention at their hands, than the continuous outflow of decaying refuse and infectious matters. The effect of such criminal neglect can not be represented in numbers, the diseased are not reckoned in the long roll of mortality.

The nurse should be the very impersonation and perfection of cleanliness, and not an animated lump of dirt and grease; she should be intelligent, quick and full of resource in emergencies; cheerful and amiable of disposition, not inclined to depression and moping. She should not be in love, except with her work. She should have great tact in dealing with patients, be quick to detect and adapt herself to peculiarities of dispo-

sition, even to those of the congenital shrew, combining with all great decision, coolness, nerve, kindness and gentleness. The expert, trustworthy and pains-taking nurse is invaluable to the surgeon; she relieves him of many anxieties and multiplies the chances of the patients recovery.

This rigid regime carried into our obstetrics would secure better general results than have heretofore been secured. The standard of proficiency of those attending through the critical period of child-bed cannot be made too high. We all know the damage and suffering caused by ignorance at this period. Ignorance nor any form of uncleaness should be tolerated within the sacred precincts of the child-bed chamber. These cases are often trusted to the care of women without the slightest education or preparation for this all important work, often women who are not capable of deciding in any given case whether the labor is natural or otherwise. Knowing the sequela, the terrible results of the ignorance of midwives, we take the high ground that mother and child should have the benefit of a trained nurse where such is possible, and of an experienced practitioner and obstetrician.

It, perhaps, is fortunate for us that we have no record of the terrible mortality of midwives—of the death and desolation their ignorance has carried into homes. In obstetrics our mortality should be about *nil*. I will refrain from discussing any of the muted questions in obstetrical practice. In the language of the grand old autocrat of the profession: "No man makes a quarrel with me over the counterpane that covers a mother with her new-born infant at her breast," and there may be something prophetic in his strong words that in a near future an enlightened public will have a "grand jury to bring in a bill against a physician who switches off a score of women, one after another along his private track, when he knows that there is a black gulf at the end of it, down which they are to plunge, while the great highway is clear."

There is one peculiar species of nurses I would not recommend to your favor. I would not recommend the selection, as nurse, of one who approaches the bedside and, gently stroking the patient's forehead, says, "My dear allow me to soothe your pathway to the grave. It would make me very happy to deliver any little last messages you may desire to leave behind for your friends. I hope you have arranged matters so as to feel reconciled to go." A nurse of this character exercises a rather melancholy influence. Too large a corps of nurses tends to confusion and is not favorable to good work. The number in attendance upon the operator should be limited to two, with perfect knowledge of his methods, and alert in anticipation of all his wants, and at no time should there be shadow of varying from his directions.

The most scrupulous care should be exercised in preparation of the patient for operation. One solution of the distressing mortality, following the work of some men, comes of careless preparation of the patient and neglected or bad nursing and after treatment.

Commonly the treatment begins in opium and stimulants and ends in opium and stimulants and a death certificate. Unfortunately some men are still at work using opium and condemning the use of the drainage tube. Comparing the crude imperfect methods of early operators we have a very satisfactory explanation of the causes of their startling mortality. Early in the history of ovariotomy the mortality ranged from twenty-four to seventy per cent.; now it varies from *nil*, in the hands of a few operators, to fifteen per cent. Careful and thorough preparation and qualification for this work, improvement and refinement in methods, accounts for this very marked reduction of mortality. Those with the highest percentage of mortality are of that class who began the study and practice of their surgery in the peritoneal cavity, with no other preliminary experience, probably, than that of having vaccinated a baby, and without that varied practical knowledge of general surgery essential to success in this special line.

To the inquiry, who should do abdominal work, there can be but one answer: The one who has served an apprenticeship and who knows where, when and how. The study of methods and technique by those ambitious to enter the field of gynecology, does not recieve that attention its importance demands. It is approaching close to the end of a century since the first ovariotomy was done; the methods and technique then were about the same as now; the procedure nearly as

perfect, and now it may be regarded as established. Then, as now, the pedicle was ligated and dropped. A number of American operators use the ligature and drop the pedicle. Dunlap, of Ohio, never used the clamps in a long series of operations.

The man who attempts this work should be quick, yet of deliberate decision. There should be no vibrating between conflicting opinions. He should possess skill of manipulation—a finger education. He should have a clear knowledge of planes of cleavage to be followed in enucleations. In these operations there should be no dancing about in uncertain efforts; a studied procedure will give a wealth of resource to fall back upon while dealing with troubles uncertain in character, relation and fixation to adjacent visara.

Surgery is not one of the dilettante sciences, nor one of rude medicinal art. It is best illustrated by masterly, civil engineering.

I will pass, in hurried and brief review, a few of our procedures. To do hysterectomy successfully, it is, first, of vital importance to learn how to make a pedicle. Second, how to treat it after it has been made. This once understood, the operator will have but little trouble with his patients and but few deaths. In a series of one hundred hysterectomies I lost six, three malignant and hopeless; two were pyæmic long before the operation, and one I lost by bad surgery. I will not here go into the history of treatment of the pedicle.

The removal of a simple cystoma is one of the simpliest of operations in surgery, a short incision, withdrawal of fluid, and sac; tying the pedicle and closure of incision by a few sutures, is a safe and simple procedure. But the removal of adherent or ruptured cystoma, or a suppurating cystoma with a twisted pedicle, a suppurating dermoid with universal adhesions, require some surgical judgement and skill. This complicated group requires painstaking enucleation for separation of all adhesions, careful examination and repair of all adherent and injuried viscera. In suppurating forms of pelvic and abdominal disorders, the adhesions and complications are all more marked and requires manipulation, careful and painstaking toilet.

In hysterectomy we are divided into two camps, some practicing the super-vaginal amputation, with the extra peritoneal fixation of the stump which gives the best results; others practice complete extirpation or amputation by the flap methods and dropping the stump; the mortality in both operations remains high, but there are some operators working with a low mortality by the extirpation method. The surgery of hard tumors is not so serious and difficult as heretofore imagined. It is true there is a great deal of surgery in the removal of a large fibroid, but if healthy and non-adherent it is a safe and easy operation. The removal of a healthy tumor from a healthy peritoneal cavity, the pedicle made small and fixed in the lower angle of the incision, is one of the safest of major operations. Some of the large, complicated tumors require incision and retraction of the capsule anteriorly.

Small tumors are just as dangerous as large ones in a majority of cases. In the first place, if they are left alone they often become big, and in the second place, the shape of the tumor often does more to determine its dangerousness than mere size. In fibroid tumors of the uterus fantastic features in shape are often present, and the irregularity of contour may cause a comparatively small tumor to encroach in this direction or that upon organs which, if it were symmetrical, would not be interfered with at all. Shape, then, is a great determining feature in the ease or difficulty with which a fibroid growth may be removed. If it is irregular its irregularlty will give less trouble when it is small than when its size is considerable. In addition to this, it is a feature that runs into time and extent of operation. It is rather surprising now to note the frequency with which fibroid tumors occur, and these of a dangerous type. It is surprising how many of these tumors are found among the better classes, where for a long time the woman will suffer in silence and finally only disclose her trouble after the growth is considerable. Here, too, the tumor itself often is not regarded, only the mischief it has caused. Œdema, pain, pressure upon the bladder or intestines or upon the diaphragm, may, alone or together, have rendered life miserable, and the poor sufferer is no longer able to hide her pain and discomfort. What I wish here to insist upon is that in this respect so far as causing complications is concerned—the small tumor is just as apt to figure as a determining factor as the large. If the tumor is a regular, symmetrical one the compli-

cations are apt to come on late; if it is small and nodular, irregularly filling up the pelvis and abdomen, the complications grow apace with its irregularity and the bias of its nodosities, and there is no saying when the symptoms may become suddenly urgent. Combined hard and soft tumors are by no means rare. They are apt to give rise to a good deal of difficulty in diagnosis. Fluctuation may not be present in the fluid portion, but only a peculiar resiliency, while the hard mass in connection with the elastic one may simulate to some extent a pregnancy. Indeed, here we come to a real condition, not a theory. In many cases where the Porro operation is indicated this is the very state of things found. We have a hard tumor or a number of them blocking up the pelvis or extending above the pelvic brim, thus interfering with the delivery of the child. If the woman has gone on to quickening the complication can be readily recognized; but if in the early months, or with a dead fetus, we are put to our wits' end to explain the situation, especially if the tumor has been of rapid growth, concomitant with pregnancy, and never before noticed. In such cases the minutest history must be gotten, and this, in connection with all subjective and objective signs, help us to a diagnosis.

One of the most common complications to be expected with fibroid growths is the dermoid cyst. This peculiar tumor is always an unpleasant complication of any condition alongside of which it may be found. It is uncertain in its nature, painful in character, apt to be complicated in its adhesions, its contents irritating, sometimes offensive; when this is the case the utmost caution must be used to avoid infection.

Tubal disease in the presence of fibroids is most common. This is to be taken into consideration when it is argued that a fibroid can be treated *per se* without resort to surgery. Now, in relation with all fibroids identical tubal disease does not occur. There may be simple inflammatory disease, or there may be hydro-salpinx, or there may be a true pus tube, or a combination of any two of these. What we are to remember—and this cannot be too strongly insisted upon—is that the danger of the existing complications may be paramount, in its way, to the danger of the fibroid itself. None of these tubal conditions, with all that this implies, are remediable save by direct interference, as the surgeon finds them. As to what the theorist has to say about them I do not much care.

All fibroid growths are to be watched carefully for malignancy. This is not to be lost sight of under any circumstances. If we attempt to lull ourselves into repose by imagining a tumor entirely benign, we shall often be deceived in the sequence.

Another complication of the fibroid is the irreducible ovarian cyst. Here we may infer that the two masses are one, and, if the error is not early corrected, we shall have the serious misfortune before us of at temping to include an ovarian cyst and a fibroid tumor in one neud. I have in mind a neophyte who, after seeing a fibroid removed by the extraperitoneal method, a day after followed the same technique with an ovarian cyst! Such is the demonstration of surgery to too many lookers-on.

Another altogether different condition, which may puzzle the acutest diagnostician, is a tumor of the kidney crowding itself down upon the uterus. Here the commonest manifestations of fibroid tumor of the uterus are present edema, emaciation, irregular bleeding from the weakened condition of the patient. The uterus cannot be separated from the tumor, and on combined palpation resists and falls with it. In such a condition it is easy to see how any lack of surgical resource is fatal to both patient and operator, and how different is the condition to be dealt with from what has been anticipated.

Bearing in mind the rapidity with which some forms of myomata develop, it is again evident that a thick-walled ectopic sac may simulate one of these tumors.

As I have already said, there has not been, and there is not yet, a consensus of opinion in reference to the best method of removing these growths. The objections to the clamp—the instrument that has given us the best results—are, I consider, puerile. The ideal method is that which gives the best results, aside from the inherent beauty of its conception and execution.

Of the many operations and modifications proposed for the removal of the fibroid uterus, there is need of here considering but three—to wit, the operation by the clamp or serre-neud; the operation for the removal of the entire uterus; and that of stitching the peritoneum across from side to side, leaving the crevix open

in order to allow the escape of pus and ligatures in a few days. Of this latter operation it is only fair to say that the results have been apparently good, but that it is good surgery, or more ideal than the use of the clamp, to do an operation with the expectation of pus to escape from the vagina, is not at all to my understanding.

As to drugs, the growth of tumors is not affected by their use, electricity aggravates them, complicates symptoms, multiplies the difficulties and augments the risks of surgical procedure.

From my experience I feel the importance of urging promptitude in all abdominal and pelvic troubles; of early ovariotomy; of educating the entire profession up to the importance of early recognition and early removal of cystoma; of the early removal of the appendages for fibroid growths; early removal of large and rapidly growing hard tumors, of tubal pregnancy ruptured or unruptured; the early removal of all suppurating forms of tubal and ovarian disease,—*actual, not fancied disease.*

It is important that every member of the general profession in active practice should be able to recognize any and all these troubles. When such becomes a fact of the profession at large an innumerable number of women will be saved untold, unguessed affliction and misery. We have a large and constantly enlarging *need* and the *field* of *work* is *immense*, and the *energy* and *industry* with which it is cultivated should be *correspondingly immense.*

The clinic makes accessible many primary truths and casts a rich light on many difficult problems.

As for myself, so supremely, so profoundly do I feel the great importance of our work, its far-reaching concern, that I would rather by continuous, unrelaxing effort crowd into a few year's that mastery which would crown my work with something prophetic, at least, of its possibilities; a crown into which I would have threaded the lesson that our skill, our refinements and our successes must come of intelligent, tireless application, unselfish devotion and generous co-operation; this, rather than a century of human existence tinkering with the afflictions of the mothers of our race. And in this I am happy in the consciousness that the hearts of many of the Fellows of my Profession beat time with mine.

SPECIALISM, AND THE INSANE.

By MARIE B. WERNER, M. D.
PHILADELPHIA.

The close relations which physical suffering bears to the mental emotions is shown daily, and recognized. Acute suffering produces a train of symptoms which pass off promptly after the cause is removed. Chronic suffering, on the other hand, will often undermine the nervous system to such an extent, that a previously equable temperament may give way to one of an irritable and excitable character.

The fact, so often met with in practice, of the continued nagging pain induced by chronic inflammation, and which produces in some a state of nervous excitability, frequently hard to combat, unless measures are taken to remove the source of irritation, will not be disputed. Such experiences have led to more careful investigations and researches in all the various special branches, and we have to-day the oculist aiding the neurologist in not only studying each case, but also aiding and directing cures, before deemed impossible. The surgeon's knife and trephine has achieved results, of which we can all be justly proud, in cases of epilepsy caused by trauma, or in idiocy induced by the general compression of the contents of a prematurely ossified skull. These special studies are the arms which gather in the suffering and needy to afford help and to make the body of the profession stronger. Another arm has been reached out in the last few years, but unfortunately has been misunderstood by many: Gynæcology, in its recent progress, has opened up many avenues for the cure of ills that were for a long time unrecognized in their entirety. Many have expressed themselves unfavorably, maintaining that extreme measures are resorted to more often than actually called for. Let us take an impartial view of this matter, confining ourselves only to those cases where *actual disease* can be demonstrated.

How often has the practitioner of long experience seen certain theories arise and die out after a time? Was that not because they had not sufficient foundation to live? "Truth remains, though the heavens fall." Who would think of allowing an abscess to burrow in loose structures, when an incision and well directed treatment will arrest the mischief and save the

patient from blood poisoning? Is there a surgeon who would hesitate to resort to the knife in any case, where, say gangrene or tuberculosis of any limb threatens life? Why should disease out of sight be treated less radically than that which can be seen? That each operator has in his early experience done some work, which he felt by knowledge gained later, he might have done better no one denies, but one cannot judge the other lest judgement fall back upon the judge. There are many hundreds who thank the surgeon's knife for the comfort they now experience, and the lives of usefulness they can led; and many feel the bitterness of the words "too late."

Some operators, who have successfully dealt with multiple and single abscesses in the pelvic structures, which had given rise to periodic attacks of pelvic peritonitis and in consequence to vicious adhesions which alone often give rise to the most painful symptoms, have extended their influence and knowledge in the direction of that class of unfortunates, who often cannot understand or make known their sufferings, viz., the insane. Their results have on the whole been encouraging, in so far that they have removed one source of irritation, always having in mind *to operate only in cases where disease can be demonstrated beyond a doubt.*

During the summer of 1891, in a conversation with Dr. Alice Bennett, of the Norristown Asylum, I found that she considered the presence of insanity an expression of destructive changes in the nerve cells, and from that standpoint a cure becomes impossible. For that reason she discouraged investigations on this point. In April, 1892, I received Dr. Bennett's permission to begin a series of studies at the Asylum in the early part of the following May, hoping, thereby, to aid in solving the important question Can the Gynæcologist aid the Alienist? And, for the benefit of those impartially interested, I will give a summary of thirty cases examined, and of two sections done on July 3rd, 1892:

Case I. Melancholia, following last labor, vagina examined; small mass in right pelvic space; prolapsus of uterus; lacerations of cervix and perineum.

Case II. Acute Melancholia. First attack supposed to have been induced by the establishment of puberty; second attack followed third labor; uterus fixed posteriorly; mass to the left; right ovary prolapsed.

Case III. Acute Mania. Attack sudden, in August, 1891; patient aged forty-seven; vagina examined; uterus drawn to the left; painful mass on right side; cyst of right labia: complains of pain down legs when walking.

Case IV. Melancholia. Second attack, vagina examined; uterus antiflexed; masses both sides.

Case V. Mania. Vagina examined; uterus retroverted and fixed; body large, cervix small; rectal examination reveals masses on both sides.

Case VI. Melancholia. Three months after birth of child. Uterus retroverted and fixed; external hæmorrhoids.

Case VII. Melancholia. Uterus enlarged, fixed to the left; mass on right side; cystic degeneration of cervix.

Case VIII. Mania. Multinodular Uterus; masses on the right side with tenderness; cystic degeneration of cervix, and bleeds to touch.

Case IX. Mania. Uterus enlarged; some impaired mobility; cervix cystic and eroded.

Case X. Mania. Last labor occurred six months before admission. Uterus enlarged, somewhat hard; moderately movable; cervix patullous; bleeds readily.

Case XI. Chronic Mania. Brain fever marked the onset of the attack; uterus retroverted, prolapsed and fixed; tenderness in both pelvic spaces.

Case XII. Mania. Mass in right pelvic space; perineum lacerated.

Case XIII. Melancholia. "Was not well after last child was born." Uterus prolapsed; laceration of cervix and perineum.

Case XIV. Mania. Second attack; uterus fixed, masses on each side; laceration of cervix and perineum; kraurosis of both vaginal orifice and vulva.

Case XV. Mania. Small undeveloped uterus; fundus posterior and to the left; moderately movable.

Case XVI. Mania. Last child July 20, 1891; placed in Friend's Asylum, August 8, 1891; uterus fixed anteriorly; tubes tortuous and enlarged; left ovary cystic; laceration of both cervix and

perineum; varicose veins at vulvar orifice.

Case XVII. Imbecility. Three children; last, four and a-half years before attack; uterus fixed posteriorly; masses on both sides; cervix patulous and lacerated; also perineum; hæmorrhoids.

Case XVIII. Mania. Last labor thirteen months before attack, which was gradual in onset; uterus and appendages normal; marked lateral tear of vaginal wall nearly to cervical junction, causing prolapsus.

Case XIX. Melancholia. Onset four months after last labor; uterus prolapsed and retroflexed; mass in left pelvic space; movable body in right pelvic space like the ovary.

Case XX. Chronic Mania. Uterus atrophied; laceration of cervix and perineum; some cicatricial bands in vagina.

Case XXI. Second attack. Atrophy of uterus; pelvic spaces free; some laceration of perineum.

Case XXII. Melancholia. Third attack. Antiflexed enlarged, but movable uterus.

Case XXIII. Second attack. Antiverted uterus drawn to left; mass to the right.

Case XXIV. Melancholia. Cause puerperal; uterus enlarged and prolapsed; mass on the left; lacerated perineum; external hemorrhoids.

Case XXV. Chronic mania. cause puerperal uterus fixed anteriorly, cervix large, body small and flabby. Tender masses in both lateral spaces; old fistulous tract to the right of the anus extending directly upward beyond the internal sphincter.

Case XXVI. Acute mania. Second attack. Antiflexed uterus; engorged cervix and vagina; mass on right side.

Case XXVIII. Chronic mania—pelvis of male type, vagina short, uterus undeveloped, fundus backward; cannot distinguish the appendages.

Case XXIX. Mania. Fourth attack. Vaginal examination, uterus fixed posteriorly, tender mass on left side. Section July 3rd, 1892, removed appendages; cystoma of left ovary; right ovary undergoing calcareous degeneration; both tubes undergoing tubercular degeneration; there were some adhesions from a recent peritonitis. Patient made a rapid and uninterrupted recovery; was discharged cured five weeks after the operation.

Case XXX. Acute dementia. Admitted 1888; vaginal examination; enlarged anteverted uterus; mass on right side distinct; complains of great tenderness in left side which feels boggy. Section, July 3rd, 1892; removed appendages; hydrosalpinx of both sides; left tube degenerated to a large cyst; dense adhesions to bowel uterus and posterior-cul-de-sac. On right side tube somewhat smaller but tortuous, fimbriæ of both obliterated. Used drainage thirty hours; patient made a good recovery, which I understand also includes marked mental improvement.

These cases have made me feel that there is a necessity for careful study of all cases, and especially those in which the puerperal period antedates an attack. If a remote irritation can lead to insanity or epilepsy, why cannot an abscess, tubercular disease or other pelvic inflammations, also enter the field as causative factors? The claim is not to cure by operation, but by removing the irritation and thus aiding nature in restoring, gradually, perhaps, its lost nerve force.

The presence of pain, a prominent symptom sometimes in the sane, is more often absent in the insane. This was markedly shown in a case, seen at the asylum, of probable osteo-sarcoma of the elbow of an insane patient. During the early stages of the disease, continued motion and increased excitement seemed to take the place of expressions of pain though she stoutly denied its presence. This became the more striking after the disease progressed, involving the greater portion of the arm, when she attempted to cool her arm in water and begged for a dose of magnesia.

It is impossible for the alienist to be a specialist in all branches of medicine; and it is a fact, that the insane are subject to all the diseases the sane are troubled with; hence the necessity for special work in special directions. This work however should be a conscientious painstaking study of each individual case, and the fame accruing should be based upon the products of such study and not upon the number of operations done, else the object is defeated at the beginning.

Sept. 28th, 1892.

Clinical Lecture.

THE ETIOLOGY, PATHOLOGY, AND TREATMENT OF FLAT FOOT.

By A. M. PHELPS, M. D.,

Professor of Orthopedic Surgery in the University of the City of New York and in the Post-Graduate Medical School, and Professor of Surgery in the University of Vermont.

Prof. Phelps first called attention to a cast, showing hallux valgus and an absence of the arch of the foot, while the outer aspect of the foot was rotated upwards, and there was apparently a dislocation of the scaphoid bone and the head of the astragalus.

Cases of flat foot are frequently congenital and in many children, up to the third or fourth year the arch of the foot will disappear when they are standing. This is owing to the bones of the foot not having become fully ossified at this time. Hereditary influence is also often traceable in these cases. Flat foot may result from paralysis of the flexor muscles of the foot —the tibialis posticus and the long flexor—by depriving the arch of the support given it by these muscles. Occupation is an important etiological factor, as those who are compelled to stand for many hours every day in one position often suffer from a relaxation of the structures holding up the arch of the foot. Those having a tendency to flat foot will often find the condition aggravated by a change of residence from the country to the city, owing to walking on hard pavements instead of on soft earth. If in addition to this, they develop much adipose tissue, flat foot is still more likely to occur. One's manner of walking is also of importance; every person should toe inward, for, when the foot is in this position the blow is received on the outside of the foot. Savage tribes walk in this manner, but civilization has given us the walk of weakness. These are the main points in the etiology.

Exhibiting a model of a typical flat foot, he explained how a true talipes valgus would result from a still further rotation of the foot. The first change which takes place is a lengthening of the soft parts, or girders of the arch of the foot; following this comes pressure between the scaphoid bone and the neck of the astragalus, and between the scaphoid bone and the internal cuneiform, which, when long continued, results in irritation and perhaps even in inflammation. Lastly there is spasm of the muscles supplying the joint with growth of new bone about the articulation, the result of pressure, precisely as is seen in lateral curvature of the spine upon the concave side of the curve.

This inflammation or irritation of the joint results in reflex spasm of the extensor muscles, chiefly of the peronei, which, if long continued, produces a true talipes valgus, together with a hallux valgus. In these cases there is always observed a lengthening of all of the soft parts in the sole of the foot.

Talipes valgus would not occur unless this pathological condition took place, which allows of dislocation downward of the scaphoid bone, the result of this unnatural lengthening of the soft parts.

Prof. Phelps exhibited drawings made from dissections to illustrate the condition of the parts. In the first one, which was taken from an extreme case of flat foot, the scaphoid bone was seen to be dislocated downward with the head of the astragalus, and a change had taken place in the articular surface of the cuboid bone. There was a growth of bone around the joint where the fibula had pressed into the os calcis. Another drawing showed the arch broken down, and the foot twisted upon itself, giving rise to a hallux valgus. He showed, by means of diagrams on the blackboard, the varying mechanical effects produced by the same force exerted upon arches of short and long curvature, and in this way explained not only the manner in which the deformity is produced, but the manner in which the remedy was to be applied.

Acting upon these mechanical principles, various appliances had been devised: Reynders puts a spring into the sole of the shoe; Dr. Royal Whitman has a plate molded over a cast of the foot, and then applied to the sole so as to hold up the arch; Thomas has suggested making the sole thicker on the inside than on the outside, thereby transmitting the weight through the cuboid bone, and so relieving the scaphoid from the pressure. Dr. Phelps had also had constructed after a German pattern, a shoe in which the patient walks upon a strap, the thickened sole on the inside of the foot everting the

foot in such a manner as to transmit the weight of the body through the cuboid, thus relieving the scaphoid bone.

These appliances are all useful in their proper place, but it is wrong to begin treatment with such instruments.

Commence the treatment by etherizing the patient, pressing up the arch of the foot, and then applying plaster-of-Paris. If the peronei tendons are much shortened, divide them, twist around the foot as much as possible, and super-arch it. This treatment should be continued for sometime, re-applying the dressings and correcting the position of the foot as often as may be necessary. When all that can reasonably be expected from this treatment has been accomplished, spring soles and similar appliances may be used.

When there is a hallux valgus, this should be at once corrected by operation, and this in itself, will sometimes cure the flat foot so far as the element of pain is concerned. Every case of flat foot is very likely to relapse, no matter what is the method of treatment adopted, unless carefully followed up and the foot kept well supported. If the foot can be placed in such a position that the weight of the body is transmitted through the cuboid bone, pressure on the inner side of the foot is relieved, and hence very little pressure will be required to hold up the arch of the foot; but if this be not done, so much pressure is brought to bear upon the springs that they cannot be tolerated. During the course of the treatment the patients should be taught to walk with the toes straight ahead, or, if possible, turned inward. They should also be instructed to strengthen the muscles about the foot by frequently raising themselves on their toes.

He does not share in the opinion of some authors that the tabialis anticus has anything to do with holding up the arch. If this muscle be paralyzed, the arch of the foot may or may not be relaxed.

Dr. Phelps then took up the question of operative treatment and presented a patient upon whom he had operated for flat foot. This young man had been treated for a number of years, but the condition had proved a most obstinate one. Almost all the usual methods had failed to give more than temporary relief.

The last operation, Bond's scarification, was performed six months ago. The patient is now able to walk considerable distances without discomfort, and can stand ten hours a day without pain. Objection has been made to the open operation for talipes varo-equinus, on the ground that the scar was likely to be sensitive; hence it is interesting to note that in this patient the scar tissue was quite extensive and yet he can walk upon it without any pain.

Dr. Willy Myer had presented to the Academy of Medicine some very good results obtained by Trendelenburg's method of supra-malleolar osteotomy. For those patients who are not particular about the looks so long as the foot is useful, this operation is likely to prove of service.

Communications.

THE SORE NIPPLES OF NURSING MOTHERS AND HOW TO TREAT THEM.*

By P. F. ELLIS, M. D.,
BELLS, TEXAS.

Leaving the elucidation of obtuse scientific questions to others, I have selected as a subject for this essay the plain and practical one of "The Sore Nipples of Nursing Women and How to Treat Them." The title of my paper deserves the thoughtful consideration of every medical man who has one of this class of sufferers under treatment, because certain relief follows prompt treatment, while delay brings indescribable suffering and permanent injury to the mammæ involved.

Finding so little in the literature of the day upon the subject, and that little found so erroneous and therefore misleading, long since I have adopted ideas of etiology and treatment of this affection which are at least original with me.

I find from experience that women who have pink-colored nipples are the chief sufferers; never having met with a case of fissured or raw nipples where those organs were dark-brown or blackish; neither have I met with a case in the Negro or Indian. Why this is so I will not undertake to say.

I deem it unnecessary to consume your

*Read before the North Texas Medical Association, Dec. 15, 1892.

time in giving the anatomy and physiological action of the milk-producing apparatus, but, that I may be the better understood further on, will say that the mammary gland is conglomerate, consists of numerous secreting follicles, grouped together in lobules, each lobule having a common excretory duct which joins those coming from adjacent parts of the gland. In this way by successive union they form the cylindrical lactiferous ducts. These ducts run a generally irregularly, straight, or curved course to immediately beneath the base of the nipple, where there is a very perceptible enlargement of the caliber of the tube (an ampulla) formed; at the outer end of the ampullæ quite a narrowing of the tube takes place, and at this narrowing many of the tubes are bent at a greater or less angle; from this angle a straight course is pursued to the extremity of the nipple where they emerge in fifteen to twenty openings for the final exit of the milk.

When the narrow point at the angle is insufficient to permit the outward flow of the glandular secretion, the ampullæ are distended, forming a kind of stricture that sometimes gives us the counter-sunk nipple.

The symptoms and signs of obstruction are: (1) the child sucks so hard as to cause the mother pain, while it frequently loosens its hold upon the nipple to fret and cry. The blood is drawn from the capillaries at the end of the nipple; (2) tender streaks extend back from the base of the nipple corresponding to the over-distended milk tube, and the lobules (or lobe rather) from which the obstructed canal leads is found to be hard and exceedingly tender to pressure; (3) we find the ineffectual sucking has denuded the end of the nipple of all or the greater part of the integument.

The over-distended lobe now takes on suppurative inflammation and nature undertakes to find an exit for the pent-up fluid by another route. The poor mother now suffers the horrors of the inquisition and frequently appeals to her medical attendant for relief in vain. The abscess forms and is lanced, or breaks, and relief speedily follows. The lobe involved is destroyed and the duct leading therefrom is obliterated. The child is taken from the breast and the nipple, or, what is left of it, heals.

The treatment to be of service must be instituted early, that is, before suppuration proceeds too far. The earlier commenced the more certain the cure. The plan is this: On attending a woman in her first confinement, inspect the nipples before you leave her, and if they are of that delicate pinkish cast, which indicates a thin, tender skin, ask that you be informed, if, about the fourth day when the milk should begin to flow, the child sucks very hard, and if there are tender cords or lumps in her breast. If so, prepare yourself with a small magnifying glass—one such as watchmakers use—and squeezing the nipple gently so that the 15 to 20 openings for the corresponding tubes can be plainly seen, into each of these orifices introduce a fine probe and carefully follow the canal to the ampulla. When the strictured one or ones have been passed, introduce a blunt probe of larger size and more fully dilate the so-called stricture and the case is cured at once.

The operation can be done in fifteen minutes' time. It is not necessary to use an anæsthetic, and one sitting is sufficient. There is no operation within my knowledge so easily performed, or that is so satisfactory to both physician and patient.

Should the nipple have become raw and suppuration far advanced, evacuate the abscess with the knife; turn a gentle stream of water as hot as can be borne upon the nipple; dry and let the infant nurse, and then apply the water as before, except that to each pint of the water used *after* the nursing, add one drachm of boric acid; and after using the last bath, moisten one side of a pad of absorbent cotton with a solution of boro-glyceride and apply to the sore nipple. Allow the infant to suck not oftener than once every four hours, and your patient will soon be well.

ABORTION; ITS TREATMENT.*

By I. E. WEBB, M. D.,
McKINNEY, TEXAS.

By abortion is meant the interruption of the process of gestation any time from the time of conception to the end of the fourth month. There is no condition to which a pregnant woman can be subjected

*Read before the North Texas Medical Society at Fort Worth, Texas, December 13, 1892.

that is more deleterious to her health in its immediate as well as remote effects. Abortion is a pathological process and should be dealt with as such. In studying its treatment we should first understand the condition with which we have to deal. Without going into a detailed description it will suffice to understand that the close attachment of the products of conception to the uterine wall at this stage of gestation renders it most difficult for the uterus to completely separate itself from said products because of the anatomical condition and the physiological relations.

During the earlier months of pregnancy the products of conception are more adherent to the uterine wall than at any other stage of gestation, hence, require more force for complete separation and expulsion at the time the uterus is in the most unpropitious condition for the effort. During this stage of pregnancy the increased size of the uterus is due to an hypertrophy of and increase in the cellular elements of its muscular fibres, hence, it is in a less favorable condition to contract than during the later months of pregnancy, when its increased size is due to a distention of its muscular fibres.

Nature never intended that the process of gestation should be interrupted, consequently when it is interrupted she is not so competent to carry on the process of involution as after labor at full term. The muscular fibres of the uterus during early pregnancy have not arrived at that stage of development at which the process of involution is easiest accomplished; consequently, in a case of abortion, nature is placed at a disadvantage in performing both the expulsion of the contents of the uterus and the process of involution afterwards, which is so essential to the maintenance of the woman's health. It is in assisting nature to properly perform these two functions that I wish to emphasize.

When a physician is called to a case of inevitable abortion—and it is only that class of cases that I wish to speak of in this article—his duty is two-fold: *First*, to empty the uterus of its contents as quickly as is compatible with safety to the woman; *second*, to institute after-treatment that will enable nature to accomplish perfect involution of the uterus.

In the treatment of abortion physicians are divided into two classes: *First*, those who adopt the so-called conservative treatment, which consists in using a vaginal tampon, and the internal administration of ergot to control hæmorrhage and excite uterine contractions and thereby the expulsion of its contents. *Second*, those who look upon the products of conception as a foreign body, and proceed to rid the uterus of it at once, usually by means of the curette.

Two immediate dangers connected with abortion are hæmorrhage and infection. The remote danger is imperfect involution and its results. In regard to the so-called conservative treatment, the vaginal tampon is a very unsafe method of controlling hæmorrhage, and has no place in the treatment of this stage of abortion, save to lesson the anxiety of sympathizing friends, and quiet the fears of the patient.

When a case of threatened abortion has arrived at that stage where we can safely use the tampon, that is, when it has become inevitable, the os uteri is sufficiently dilated to institute a more efficient treatment. The action of ergot in these cases is questionable, for it makes the uterus contract upon, without expelling, its contents, and, should we decide to institute a more radical treatment afterwards, we will find its administration has been a disadvantage because of the contracted os uteri which it produces.

The radical treatment, or, as I consider the most conservative method, consists in introducing a Sims' vaginal speculum, and, treating the products of conception as a foreign body which in reality it is, thoroughly curetting the cavity of the uterus, especially the placental site, removing every vestige of the placenta, and then washing out the cavity of the uterus with sterilized warm water, being careful that your irrigator allows a free return of the water, and that the force of the stream is weak. The fountain syringe being always used and the stream having only a fall of 18 inches.

During the third or fourth months of gestation we may safely wait until the uterus has expelled the fœtus and as much of the placenta as it can, providing there is no alarming hæmorrhage, before resorting to the use of the curette to thoroughly empty the uterine cavity. When the uterus is emptied of its contents thoroughly by means of the curette, hæmorrhage stops, the possibility of infection is *nil*, the uterus contracts upon itself, and is then in the best possible condition to

begin and carry out the process of involution. Ergot may succeed in emptying the uterus of the greater part of its contents, but in the majority of cases, because of its intimate attachment, there will remain some of the after-birth which is liable to decompose and infect the women, and which always prevents perfect involution, thereby producing that train of symptoms so characteristic of subinvolution, namely, prolapsus, more or less vesical tenesmus and frequent micturition, bearing down pains in the lower part of the bowels, pain in back, hips and head, more or less disturbance of the disgestive organs, menorrahagia or metorrhagia, corporeal endometritis with more or less fungosities; all the result of a failure on the part of physician to thoroughly clean out the cavity of the uterus at the time of abortion and institute the proper treatment afterwards.

When we have thoroughly emptied the cavity of the uterus, I don't think our services should stop here. Nature has yet to carry on the process of involution before our patient will be well again, and, as before stated, she is not as competent to perform her work after abortion as after labor at full term. The firmer the uterus contracts upon itself the more effectually it diminishes its blood supply, and hence the more rapid and perfect the involution. By way of internal medicines to accomplish this result I think nux vomica and ergot combined give better results than any remedies with which I am acquainted, and I believe when their daily administration is kept up for five or six weeks after abortion they always prove of advantage in restoring the uterus to its normal size. A woman should maintain the recumbent position and refrain from her household duties longer after abortion than after labor at full term. As a rule she thinks "I have only had an abortion and I can get up in a few days." It is the duty of her physician to teach her better. Furthermore, I think a woman should be examined five or six weeks after abortion, and if there is any subinvolution present the nux vomica and ergot should be continued and supplemented with the boroglyceride tampon until involution is complete. If such a course is carefully pursued with our cases of abortion, I believe fewer woman would to-day be in the hands of the gynæcologist.

Society Reports.

THE MEDICO-CHIRURGICAL SOCIETY, OF LOUISVILLE.

Stated Meeting, Nov. 25, 1892.

The President, Dr. F. S. Simpson, in the chair.

PRIMARY LATERAL SCLEROSIS.

Dr. J. B. Marvin: This patient (presenting case in person,) I saw for the first time in 1883, and incorporated his case in a report I made to the Kentucky State Medical Society, which met at Crab Orchard that year. At that time he was a student here in the Commercial College. Two years ago I saw him again at which time he entered the Baptist Theological Seminary here, where he is studying at the present time. I have not examined him since, and have only seen him once or twice in an attack that he called colic. The case is an extremely interesting one. It is not often that you can obtain as complete history and one that can be followed for several years. He has all the symptoms of lateral sclerosis; there is no history of injury, or specific cause, which would account for this transverse myelitis, and it looks more like a case of primary lateral sclerosis than I have ever before seen. Perhaps the early history of the case is best told in the patients own language.

"I noticed the first indications or symptoms of this trouble when I was fifteen years of age, at which time I was working on a farm down in Tennessee. We began our farm work early, some time in the month of January. About the middle of May I began to have a very tired feeling and would often have to sit down and rest; after sitting quietly for a half hour or so, I would get up and go on about my work but would not feel rested, especially about my limbs. Matters went on in this way until I was twenty years old. I would go to school for a few months in the year and work on the farm the balance of the time. About this time I experienced a little hesitancy in picking up my feet, but did not think anything of it, and went on working in that way until I was twenty-three; then began to use my cane a little, having greater difficulty in moving my limbs and feet, particularly in lifting my

toes from the ground. I have continued to go along in about that way until the present time. I am inclined to attribute the trouble to over-labor on the farm; if this be not the cause, then I do not know what it is. I never sustained an injury that I am aware of; have been thrown from a horse twice, but do not remember to have been injured, other than a thorough shaking up. The trouble does not seem to have progressed much, that is, since I was twenty-three years old; I can stand in one position without any tremor; it tires me more to walk than anything else. I say it has not progressed—I believe I have noticed that it hurts me more to go up the stairs, since I have been at the Theological Seminary, than it ever did before. This may be accounted for by the fact that I go up and down a great deal, and it is necessary for me to be on my feet several hours each day. I want to say this, that I am exceedingly anxious to be relieved of this trouble and would be very glad if some means could be devised to accomplish the desired end."

Dr. J. B. Marvin: When this man first came to me he had typical stiffness and rigidity of the muscles, with a tendency to contraction, and almost absolute inability to lift his toes from the ground. He had most marked tendon reflexes, as well as ankle-clonus and decided tremor. He has always had good digestion; there has been no disturbance of the bowels; no interference with the renal secretions; and he is mentally as well as he ever was. He has never had any eye or head symptoms. As far as medicine is concerned, I have told him there is nothing that would do him any good; the damage is done, this degenerative change has already taken place, and that he would have to make up his mind to be a cripple for life, so far as his legs are concerned. The trouble does not seem to affect him further than that. There is no atrophy of the muscles of the legs. The increased reflexes, rigidity and peculiar walk, make the diagnosis.

In regard to the localized lesion: the only question is, what was the cause, whether it was primary or secondary degeneration. I am inclined to the opinion that it is primary; certainly all the symptoms and history point in that direction. Authorities claim that there is no case on record in which the autopsy proved that this is a purely primary trouble, but that it is always secondary. Of course, it is very difficult to determine whether a man has not received an injury sufficient to cause some of the symptoms present in this case, and it may be that in a fall or in his work he has sustained a strain sufficient to produce irritation in the cord —secondary degeneration. There is absolutely no history of specific trouble. He claims never to have suffered a pain of any kind in his life. Another strange feature, if this is a secondary degeneration, is that in this length of time he has not developed any head or ocular symptoms. It is not often that we have an opportunity to watch a case of this character for nearly ten years. I do not think that there can be any doubts about the diagnosis. It seems to me to be a typical case of primary lateral sclerosis

---

SPECIFIC LESION.

Case No. 2. This young man I saw for the first time this morning. You will observe he is a very strong, healthy looking individual, but in walking he uses his legs as though they were pegs, not stiff exactly, but lack flexibility. All the muscles of his legs are very hard; there is no patella reflex; legs are œdematous along the tibia and pit on pressure; there is no œdema above the knee or on the ankle; he has a very irritable heart, quick pulse, short-winded, pulsation at the base, hurts him to go up steps, but no organic disease of the heart, and no murmur at all; has suffered some slight pain in the chest. This young man, with several of his companions, a few weeks ago, started out to run one-eighth of a mile—a foot race for this distance, and, he says, his "wind" gave out before he had gone more than a few rods, and since that time he has been troubled more or less by this peculiar clumsiness or stiffness of his limbs. When I made the first examination I found him wearing a suspensory bandage. he also had a very large bubo on the left side. Before I examined him I had a suspicion that it was specific trouble, and do not now think there can be any doubt about it. It is one of those cases, which, if it goes on for a while without treatment. would be classed "locomotor ataxia," and some man who understood his business treating it properly, the case would be reported as cured of locomotor ataxia. It

has every resemblance to locomotor ataxia in the absence of the patella reflex, although this might occur in other troubles. I do not think it is necessary to look for any other cause than specific infection, and I believe specific treatment is clearly indicated.

DISCUSSION.

Dr. A. M. Cartledge: I would like to see this boy go without specific treatment for ten or fifteen days; I cannot help believing that there is a traumatic element in the case. I fail to locate the specific lesion in the phenomena observed. In the general symptoms I do not see anything indicating syphilis; the œdema and hypertrophy of the muscles might be accounted for by simple trauma. I believe that absolute rest with probably some local application to his limbs would be the most rational treatment.

Dr. A. M. Vance: I believe the last case is undoubtedly one of cord trouble. I do not think the effort he made had anything to do with it. The œdema could easily be accounted for by the rigidity of the muscles. In fact the œdema signifies nothing; it is not uncommon to see that much œdema in a perfectly healthy man, especially one who stands up a great deal. I believe that the great majority of the cord lesions simulating locomotor ataxia, are specific.

Dr. J. M. Ray: In regard to the eye symptoms in these cases—I have under observation for some time, three cases of one-sided midriasis that are peculiar. The first time I saw these three patients was about six years ago, soon after I came to Louisville. They all had one-sided midriasis and one-sided ciliary paralysis. I have watched all three of these cases, carefully observing all the symptoms. One of them at that time had absolutely complained of nothing; now he is a confirmed locomotor subject. When I first saw him he had no evidence of locomotor ataxia at all. Another one in the last eighteen months has been suffering from what he says is sciatica; has been having pains up and down one leg. For this his doctor has been using a strong galvanic current. The third one was in my office a few days ago, and I questioned him pretty closely, but he denied having any pain at all. However, he did state that after he had stood on his feet for a while, when he started to walk his feet felt like they were padded or cushioned. I believe this will develop into locomotor ataxia. All of these patients are between thirty and forty years of age; I saw them all about the same time, and they all absolutely deny any specific trouble.

Dr. J. B. Marvin: In my experience I have only met with two cases of locomotor ataxia in which there was a joint lesion. I believe that these cases may be very insiduous in their development, and may develop occular symptoms very early, like those mentioned by Dr. Ray. I have one case under observation now which I have been watching for about fifteen years. The first sympton that attracted my attention was the condition of his eye; contracted; permanently fixed pupil. He went on this way for a long time without developing other symptoms, until two years ago when he began to have symptoms interfering with his locomotion, that is, his equilibrium, pain in the legs, staggering walk, etc., etc. He has improved greatly under iodide of potassium. There was no history of syphilis in this case.

A CASE OF MALINGERING.

Dr. A. M. Vance: I would like to mention a case: Two years ago Dr. Mathews asked me to see a patient with him, a young woman in this city who claimed she had chronic constipation; that sometimes she would not have an evacuation of the bowels for six months. Her father and mother both corroborated this statement. She looked like a moderately well nourished woman, brown skin, good color. Dr. Mathews and myself put her under chloroform to see whether there was an accumulation of fecal matter in the bowels and examined her by palpatation, but could not find anything. We then injected into the bowels a large quantity of water, under chloroform, after which there was only an ordinary evacuation. I am absolutely sure that the bowels contained no more fecal matter than in a person who has an ordinary evacuation every day. I believe that this woman was deceiving her parents, and that they were perfectly sincere in their belief that she only had an action of the bowels once in six months. I believe that she had an evacuation every day. While under chloroform we thought she was dead because of a cataleptic spasm which came on.

DISCUSSION.

Dr. A. M. Cartledge: I treated this patient in a violent attack of facial erysipelas; she made a good recovery, and there were no symptoms indicating a disturbance or irregularity of the secretions.

FURTHER REPORT OF CARE OF SARCOMA OF UTERUS.

Dr. C. Skinner: I would like to hear a continued report of the case operated upon by Dr. Vance recently at the Infirmary for supposed sarcoma of the uterus.

Dr. A. M. Vance: The patient in question has made an excellent recovery. It has since developed that the section shown upon slide of the microscope, which was supposed to have been secured from the horn of the uterus, was taken from the fallopean tube, or, in any event, from some portion of the specimen remote from the horn of the uterus. If it was sarcoma it was evidently all removed, as there has been no recurrence. The woman has menstruated twice since without pain, which had not been the case for twelve years prior to the operation.

MIGRATION OF A LIGATURE.

Dr. C. Skinner: I want to report a case showing how a ligature will migrate. In June last I operated upon a woman removing a tumor about the size of a large cocoanut, took out the uterus, tied off the ovary on the other side, putting on a double ligature—Tait ligature—treating the pedicle extra-peritoneal. The wound healed up very nicely and the ligature to all appearances was absorbed. The woman has been perfectly well ever since. About two weeks ago she brought to me a thread that had come out of this old scar. It had opened slightly afresh, discharging this portion of the ligature. I know it was the pedicle ligature from the way it was tied. The wound again healed and there has been no further trouble.

AMPUTATED HIP—CONTINUED REPORT.

Dr. A. M. Vance: Some time ago I reported the case of a boy whose leg was amputated at the hip. I would like to make a continued report of the case, as it is a very remarkable one. This boy's history was about as follows: He had hip joint disease coming on when he was about ten years old—there was rapid formation of pus with abscess in Scarpa's space. At the time of opening, upon the introduction of the finger, it was found that the tissues between the femoral artery and the abscess were very thin, and we did not put in a drainage tube fearing that sloughing would take place. About a month after opening the abscess and after running a very septic course, early one morning the femoral artery ruptured spontaneously. The leg was amputated at the hip forty-eight hours afterward as the foot was gangrenous. Operation was done very quickly, the patient being on the table but a few minutes, but his condition was such that his recovery was doubtful. About two months after this he had an attack of double pneumonia; he was still in a very hectic condition, and very little recuperated from the state of depression he had already arrived at and looked as if he was going to die shortly, but the crisis came after about three days. He recovered from the pneumonia, that is the right lung cleared up very well, but the left side of the chest remained dull, the heart beating over to the right side, and we soon found that he had an immense accumulation of fluid in the left chest which was tapped three times. Three and one-half pints of fluid removed the first time; two pints the second and two pints the third time, a pint of which was pus. By this time he was getting pretty shaky again, and I determined to give him another chance, so excised the eighth rib about a week after the last tapping. The cavity was thoroughly washed out with hot water and two large drainage tubes inserted. In washing out the chest, it was done very thoroughly, throwing the water in through one tube which came out of the other, and with each inspiration and expiration it would work like a force pump. The tubes were allowed to remain in for about ten days, when they were removed and a pledget of gauze inserted into the cavity; this was also removed in a few days and the wound healed perfectly.

I think it is quite a remarkable case, the patient going through two grave operations and double pneumonia inside of three months.

DISCUSSION.

Dr. A. M. Cartledge: I have recently had several cases of empyema, which have been operated upon by resection of a por-

tion of rib. One case was particularly interesting in that the matter discharged through a sinus in close proximity to the pericardial sac. The patient has done very nicely and the tube will be removed to-morrow or next day. I would like to ask Dr. Vance what method was employed in amputation at the hip joint to control the bleeding.

Dr. A. M. Vance: The artery was already tied owing to spontaneous rupture. I read a little paper the other day at the Southern Surgical and Gynæcological Society making a plea for more rapid surgical work. I will state that in the amputation at the hip which I have just reported, the operation was done and the boy back in bed in less than nine minutes.

I believe that two or three minutes more would have caused his death. Resection of the rib was done in seven minutes; of course this is a much easier operation than amputation at the hip.

Dr. J. B. Marvin: Bearing upon Dr. Vance's case: The question has often arisen whether there would be any depression after resection of a portion of rib in cases of pleuritic trouble. I have recently seen several of these cases, in all of which there seemed to be perfect restoration of the lung and no depression. From the external appearance you would never know that a piece of rib had been removed, and the pleuritic effusion evacuated, except for the existence of the old scars.

Dr. A. M. Cartledge: I would like to ask Dr. Marvin if he does not believe all of these cases of pleuritic effusion, whether purulent or otherwise, are microbic in origin?

Dr. J. B. Marvin: Yes.

Dr. A. M. Vance: In all the cases I have had there has been perfect restoration of the lung.

Dr. J. E. Hays: Is it necessary always to remove a portion of rib to bring about drainage in these cases?

Dr. A. M. Cartledge: I believe that in seventy-five per cent of the cases it will be found necessary to resect part of the rib.

Dr. J. E. Hays: I remember a case I had while I was *interne* at the city hospital; an incision was made in the seventh intercostal space, a drainage tube inserted and the cavity thoroughly washed out with carbolized water. The patient made an excellent recovery. It never became necessary to excise the rib. Before the operation the patient was almost unconscious. Chloroform was not administered.

Correspondence.

MEDICAL LEGISLATION AND MEDICAL EDUCATION.

S. S. TOWLER, M. D.
PENNSYLVANIA.

To those who believe in the dignity of the profession and strive to maintain it, the efforts now being made "to advance all along the line" in medical education, are most comforting. The candid admission, that Medical Education was not what it ought to be, and that ignorant and incompetent "graduates" were each and every year being turned out by the hundreds, was the first step in the right direction. I say the first step, because it is impossible to reform either the individual, class, or community, until they are first willing to admit that the wrong exists and realize it. The next step taken was equally important and encouraging, viz., the recognition of the fact that it was one thing to object and find fault, and an entirely different thing to do better.

We have medical colleges east and west, north and south, that we are justly proud of, as we also are of the fact that the leaders in the American profession are the peers of any in the world. Three and four year terms, "Clinics," and "Polyclinics," practical teaching and bedside knowledge, with the more rigid requirements for matriculation are great steps forward. How the "old man" sighs, as he thinks of what he might have been with these advantages in his early days. Every man who loves his profession, honors the professors and trustees, who have stepped to the front, and propose "to fight it out on this line." What a pity it is that these efforts can be and maybe; yes, will be, to a large extent, rendered unfruitful for years to come, owing to the cupidity of other professors and trustees, and the indifference of the public. The one class, those colleges that will not march forward, only see in the more stringent requirements of the better colleges, increased prosperity for themselves. They know that the same class of students who fill their seats now will continue to come, and the more readily on account of the longer terms and more strict requirements of the other colleges. The man who simply wants "to get through" will still

go there and he knows that he will get through. "Ten months and I'll be a doctor," is a tremendous temptation for the young fellow who despises the plow, work shop and the mill. "Ten months," why he can't "graduate" on either the farm, or in the work shop, or mill in that time, and he knows it. A young fellow asked me not long ago, "Doctor how long does a young man have to study before the Presbyterians will ordain him?" "About seven years," I replied. After a long silence he said, "I guess I'll be a doctor, there is ———, only two years ago he was driving a meat wagon,and look at him now. He is "Mike with Pete's boots on." Perhaps there was something in the meat business that specially fitted him for the profesh, eh!" It was a very sickly smile that came on my face at the joke. "Ten months is bad enough in itself, but when even the ten months are put in a desultory manner, as they often are, what kind of a graduate can we expect?" It is always with a feeling of pain and sometimes reluctance that I write or talk on this subject, for no one can know more about the hardships of the poor, young beginner than I did. I sympathize deeply with the young fellow that leaves college with almost his last dollar gone and whose only hope for another is in an early and timely patient.

After twenty-five years' practice I can look back and see how much better it would have been for me, had entrance into the profession been more guarded though it would have been very hard on me at the time. I could *not see it then*—I *know it now*—and so does every candid practitioner of years' experience.

Yet in those days I think preceptors took more interest in students than they do now. I know I owed to a preceptor all the practical knowledge I had when I began practice. He took me with him to to see his cases and would patiently explain the situation. He would stop the buggy in the woods where he gave me lessons in medical botany. It was very pleasant and very practical, equally practical, but not so pleasant was sitting on the back office floor, with a big iron mortar between my knees, pounding green roots and powdering assafœtida. Those were not the days of "elegant pharmacy." I have dropped into this personality because in the correspondence occasioned by the publications in this journal of my paper on "Medical Legislation," has appeared in effect this, "your position and arguments are all right but its hard on the young fellows." I know all about that side of the question and my present conclusion is simply one of conviction after years of practice. I believe from my own experience, as well as from the logic of the situation, that it is very much better for the student, hard as it may now appear to him, to put in four years instead of two, and infinitely better for those amongst whom he will practice. Besides this, practice is not to-day what it was then. He is a bright student and a worthy graduate, who at the end of three, yes, four years, is fully up with the times in these days. It is impossible, with all the meaning that the word implies, for a young fellow to-day to leave a common school and with the ordinary common school education to enter a medical college of the advanced grade, and at the end of four years, come out, up with, and abreast of the times. Impossible, because the foundation is not there to build on and he will have no time to spare undermining the superstructure in order to rebuild the foundation. It will be too late to begin taking out the wooden posts to put in a stone wall. Advanced medical knowledge of this day is simply a stupendous study. None know it better than those of by-gone school days, who are trying to keep in these latter days, at least within hailing distance of the new discoveries and ideas. All this, however, is of no consequence to a class who long to pose as "professors," and the class who want to pose as "doctors." With them two terms of five months each will still be long enough.

Then that other class, the indif, ferent public. Indifferent, because they do not realize the situation; indifferent, because so many in the profession are indifferent; indifferent, because to them "a doctor" is "a doctor," regardless of his qualifications. This public indifferance is more than astonishing when one thinks of what it involves. Then there is the consequent factor of this indifference, ignorance, as to the needed qualifications. Yet there is no subject of which the average citizen, male and female, assume to know so much as that of medicine. Consciously or unconsciously, they assume to know, as witness the dismissal of worthy

medical attendants and employment of the quack without reason or even inquiry. It is perfectly safe to say that not only us country physicians have our patience tried with this sort of thing, but that not a prominent city physician but has had patients leave him and go to an ignorant pretender. It is not only the ignorant public that do this, but judges, lawyers, merchants, and sorry I am to say, many clergymen.

This reminds me of a funny incident. Two years ago I was sitting in the almost empty Senate chamber at Harrisburgh conversing with that prince of good doctors, Prof. John B. Roberts. We were going over the "Examiner's Bill" together, and Dr. Roberts was in deep earnest. It is only justice to him to say that he instilled a good deal of his enthusiasm into me. As the good doctor was thus laying it earnestly down a prominent member of the "House" passed by. On my return to the "House" side of the capitol, this gentleman who was always jolly, said to me, "Who is the distinguished looking friend over in the Senate?" I replied, "Dr. John B. Roberts and he is very much in earnest over the Examiner's Bill." "Ah!" said my friend," probably some quack has coppered one of his best patients." I laughingly assured the honerable gentleman "that that was *not* one of the arguments that the doctor had advanced."

Now what is to be done with these three classes. The professors "of Cupidity," the anxious "to get through" student, and the indifferent public. Can the professions or the public afford to wait until the people are educated up to the *discrimination* process? Certainly not. When the educated layman has reached that point, we must still remember in the interests of a common humanity, that "the poor ye always have with you." The poor, the ignorant poor, whose father, mother, son, daughter, baby, is just as dear, and whose life is just as precious to them as those of the learned, or "better class" are to them. It were a shame on our manhood to leave these victims to the pretender.

The remedy is *Medical Legislation.* That, and that alone, provides the remedy and as it is for public protection, it is the natural and rational remedy. While the State Medical Society is bending its efforts to secure this public protection, those colleges that have adopted a three and four year course, can not afford to stand idly by. To make the advance effective, they must like good commanders, protect the rear. It will not do to simply pass a faculty resolution of approval. "Cordial Sympathy" effects nothing. The other side won't pause, passing and monkeying with resolutions. They will be and are *at work.* The faculty of every three course college should at once get in line, and communication with Dr. McCormick, chairman, and Dr. Roberts, secretary of the State Committee.

Gentlemen of the Pennsylvania Regular Faculties,—Country Doctors can only contribute their mites, you can "pour out" of the welath of your brains and influence. Besides your personal influence you have behind you, *in your Alumi*, a powerful army. Call these to the front to battle for the honor of their Alma Mater and the advancement of the profession, and do it now.

The *Pittsburgh Medical Review*, of December, says: "The merely passive approval of the friends of the bill is more to be feared than the activity of its enemies." That is the situation exactly. "Whoop her up for all your worth" is neither elegant or professional, but it expresses what needs to be done very fully. The profession can not afford to pass, or attempt rather, to have bills passed by *Legislative tricks.* The bill that will be put before the Legislature is worthy enough to pass on its merits without change or admendment. The State can have nothing to do with "Sect" in medicine, any more than in Theology. That position once taken and the Thomsonian, the Hydropathist, the Vitapathic, and every other "pathic," and "ism" would have a right to state recognition. The proper thing to do is for the profession, as a whole, to stand by the State Society's bill, as *it is*, and thus work for public protection and honor ourselves.

Removal of the diseased part of the ovary, when not more than half of it is involved, is now advocated and practiced by advanced gynecologists. The remaining part of the ovary is neatly stitched together with fine sutures and good results are reported.—*Ex.*

THE
Medical and Surgical Reporter

ISSUED EVERY SATURDAY

ADDRESS:

Care P. O. Box 843, Philadelphia

PENFIELD BROS., Publishers.

NOTICE TO CONTRIBUTORS.

We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

Terms. Five dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

Remittances should be made payable only to the publishers, and when in sums of five dollars or less should be made by Postal Note, Money Order or Registered Letter.

THE MEDICAL AND SURGICAL REPORTER.

SATURDAY, DECEMBER, 31ST, 1892.

MEDICAL LEGISLATION.

Of late THE REPORTER has devoted considerable space to Medical Legislation and Medical Education. No apology need be offered for this in view of the great and widespread interest that has been aroused concerning these questions.

Of direct interest to the profession in Pennsylvania, and incidentally to all medical men, is the renewed attempt to obtain for this Commonwealth such legislative action as will compel those seeking to practice within its limits to furnish proof of at least ordinary capability.

An unsuccessful effort was made to obtain such enaction of the last legislature. Various explanations of its failure have been offered, *class legislation* being the general rallying cry of those opposing the bill presented. In reality the probable cause of failure was a lack of combined effort on the part of the great majority of the profession interested, while there was no such lack on the part of the opponents.

The failure of this last effort may prove eventually most fortunate for the general cause of higher medical requirements. Certainly it has tended to arouse the profession, to crystallize its opinion and to unite its effort, to secure the desired end.

Whatever objection might be raised to the bill in its present form, it certainly cannot be said to militate against any individuals or interests, theories or practices which it is not directly and confessedly intended to abolish.

Our friends who believe in peculiar or specific systems of medicine and practice, accordingly, can no longer cry *unfairness* or *persecution,* for the bill designedly omits any test that would descriminate between conflicting theories of practice.

Indeed, the most influential and liberal of the so-called sectarian organs deliberately deprives any disposed to cavil of all hope of sympathy or support from the intelligent mass of men for whom it speaks. We take pleasure in presenting the following, which will appear as an editorial in the January number of the *New York Medical Times*:

PROPOSED STATE BOARD OF MEDICAL EXAMINERS IN PENNSYLVANIA.—STATE RECIPROCITY.

Another attempt will be made this winter to establish a State Board of Medical Examiners in Pennsylvania, and we sincerely trust that it may be successful.

The copy of the bill before us provides, among other things, that the Governor shall appoint nine persons, graduates of some legally chartered college having the power to confer medical degrees, with ten years active practice, no two of whom

shall be resident of the same county and none of whom shall be a member of the faculty or staff or any medical school or university.

"SECTION 6. Provides that the said board shall examine all applicants for license to practice medicine or surgery in this Commonwealth who are properly qualified according to the provisions of section seven of this act, and no one shall be excluded or rejected on account of adherence to any special system or school of practice. It shall hold two stated meetings in each year, one at Pittsburgh and one at Philadelphia respectively, and may hold special meetings at such times and places as it may deem proper. All examinations, when practicable, shall be conducted in writing, and all examination papers, together with the reports and action of the examiners thereon, shall be preserved among the records of the said board for a period of five years, during which time they shall remain open for inspection at the office of the said board.

"SECTION 7. Any person on paying ten dollars to the secretary of said board, and on presenting satisfactory proof of being over twenty-one years of age, of good moral character, and of having received a sufficient preliminary education as defined by said board, and diploma from some legally incorporated medical college or university having authority to confer degrees in medicine, shall be entitled to examination by the said board, and in case of failure, at any examination shall have the privilege of subsequent examinations without the payment of an additional fee. Each applicant who shall have passed a satisfactory examination shall receive from the said board under seal a license to practice medicine and surgery in the Commonwealth of Pennsylvania, and the said board may at its discretion grant licenses without examination to persons holding licenses from similarly constituted boards of examiners or boards of health in other States.

"The applicants shall be examined in anatomy, physiology, chemistry, pathology, hygiene, toxicology, differential diagnosis, surgery, and obstetrics; and each applicant, upon receiving from the secretary of the board an order for examination, shall draw by lot a confidential number, which he or she shall place upon his or her examination paper, so that when said papers are passed upon by the examiners the latter shall not know by what applicant said papers have been prepared, and upon each day of examination all candidates shall be given the same set of questions."

It will be observed that the only reference to drugs is in respect to their *toxic* effect, and thus all theory as to their *modus operandi* and the possibility of danger of prejudice on the part of examiners is avoided.

We do not see what more could be asked by any school of medicine than this, in the way of protection of its rights.

There are good honest men on both sides of this controversy, men to be trusted, but they have no confidence in each other. Each party feels that the other is trying to gain improper advantage, and how to get over this complication is the question. If the leaders on both sides could know each other better, it would certainly tend to promote confidence and harmony. If the homœpathists could be satisfied that their scheme of therapeutics was not in danger, they would be less suspicious.

The dominant school would be satisfied, no doubt, with the wiping out of all sectarian designations.

The records show 8,248 physicians in the State. Of these, 6,240 are denominated "regulars" for the sake of comparison; the secretarians number 1,075; those practicing without diplomas, 933. The homœpathists claim 691, and the eclectics, 293.

It must be evident to any one that a board consisting of three members from

each school, would not be justified by the above ratio.

It is well known what the result would be were there three distinct boards, and least qualified students would get through the weaker board as was the case in this country some years ago.

It is the wish, so far as we know, of all medical men in good standing, who have the best interests of the public welfare uppermost, that each State shall have a Board of Medical Examiners before whom all candidates shall be examined, and the method to bring about this result should be made as simple as the circumstances will allow, and each school should be anxious that no injustice is done to any.

NECESSITY OF STATE RECIPROCITY.

The next thing to do is to harmonize the working of these different boards in the various States, upon reciprocal grounds.

The reciprocity should be arranged between all States where the requirements of the law respecting examinations are *similar*.

It is an inconvenience and an injustice, to ask a qualified practitioner in one State to qualify in another, where he happens to be sojourning, before he can prescribe for a patient. The proper thing would be to have a National Board composed of delegates from the several States, where the different interests would be harmonized. It would subserve the end in view if the license to practice in a State of this Confederation, would be registered in each of the other States with whom the reciprocity exists.

Let us take, for instance, the States of New York and New Jersey, where it is almost a necessity for the practitioners of one State to practice more or less in the other, for various reasons.

As the laws are at present in these two States, the physician who prescribes for a patient out of his own State is liable to arrest in the other State for so doing, and to fine and imprisonment.

In the case of New Jersey, the law has resulted in keeping people away from it in summer, because their own physicians in New York would not take the risks of coming to them in case of illness.

Both of these States now have Examining Boards with requirements nearly identical, so that license to practice in one may be made to cover both, if the authorities agree to it, and this illustration shows how the principle may be made to apply to all States in the Union where similar conditions exist.

A bill will be presented to the next session of the Legislature in this State, with the hope that these unnecessary annoyances to the profession may be mitigated by suitable reciprocal provisions.

It is hoped that every practitioner in the State will see that it is for his interest to promote this movement, and that he will explain the subject to his representatives in the Legislature, that they may be prepared to vote intelligently whenever the bill shall come to be acted upon.

Our friends in New Jersey should make a similar move at the approaching session of the Legislature in that State, then, with two States working together on the reciprocal plan, it will not be difficult to unite others as fast as they adopt the plan of State Examination.

Never poultice the eye unless you want it to rot out. In case of sty or chalazion, and the globe of the eye is not involved, the lids may be poulticed over the swelling. In the beginning of those inflammations, hot water, applied every two or three hours and from five to ten minutes at a sitting, will often abort suppuration.

Incontinence of urine is relieved by belladonna when the following conditions are present, viz.: relaxation of the sphincter vesicæ or irritability of the mucous membrane of the bladder. From five to fifteen drops of the tincture or from three to ten drops of the fluid extract should be given at bed-hour. Children require large doses. —*Ex.*

Translations.*

By MARIE B. WERNER, M. D.

Fatal hemorrhage during the 9th month of pregnancy owing to the premature separation of a normally inserted placenta. M. Maygrier (*Bull et Mimoires de la Soc. Obstet. et Gynec. de Paris, 8, '92*). Patient had previously given birth to three children; last period Sept., 1891, normal pregnancy. On June 6th while the patient was seated on a bidet giving herself an injection, she was found by her nurse in an unconscious condition and deathly pale. She was at once placed in bed when it was found that a hemorrhage from the vagina caused the weakness. Twitchings of the face and extremities took place; the vagina tampooned and an abdominal compress applied. In spite of subcutaneous injections of stimulants, etc., the patient never regained consciousness and death occurred one hour after the hemorrhage set in. The child being dead Cæsarean section was not performed.

Post-mortem examination disclosed as cause of the hemorrhage a separation of the placenta of about the size of an ordinary saucer; all other organs were in good condition. Rare as this may be, it is a complication which must always be born in mind in cases of sudden death in pregnancy.

Pregnancy in a double uterus. E. Rossa (*Wien Klin. Wochen.*, 35, 1892). The patient during her 7th month of pregnancy was taken in labor, the midwife unable to find the os, sent for a physician who found the cervix high up, the uterus normally enlarged and to one side of it, in the abdomen, a tumor could be felt which contained the fœtus. The doctor suspected a tubal pregnancy with threatened rupture and sent the patient to the hospital. An examination showed the uterus to be between seven and eight months, vertex presenting. Vaginal examination reveals a rounded tumor, which is felt more to the right of the pelvis; to the left and posterior, the finger reaches up between the tumor and vagina wall, to a normal but hard cervix. On the left side of the presenting tumor the finger feels a small opening, one cm. in diameter, through which the membranes can be felt. This opening enlarges itself with the uterine contractions. Rupture of the membranes is followed by birth, after two decided pains. Delivery of the placenta was slow, and accomplished by manual compression. A subsequent examination showed a relaxed fold in the posterior wall, which proved to be the partition, between the two vagina.

The puerperium was normal, on the third dry there was a discharge of a gray reddish membrane which proved to be the decidua—of the left uterus. This was without doubt a case of double uterus and vaginæ. Until now there have been nine cases of this kind reported, three have been pregnant, this making the fourth, and the tenth in all.

Post-partum examination revealed both uteri to be entirely separate. The fundus of each being separated from each other six to eight cm. The formation of the body is spindle-shaped, the adnexa on both sides are normal; the cervices are also entirely separate. Both uteri are normally developed and normal in their functions. The first pregnancy occurred in the left uterus as shown by the cervix and was normal throughout. The second pregnancy occurred in the right uterus. The history of menstruation was normal at intervals of every four weeks. (In a case reported by Kubasson's there were intervals of fourteen days between the menstrual epochs). The vaginae are double, but the right side ended in a blind pouch behind the right labium minor. The partition wall must have been perforated before puberty, otherwise the normal functions of the uterus of the right side would have produced tarmatokolpus. The remnants of this septum may in any future pregnancy become an obstacle during labor, as it was, in a measure, in this present one by arresting the birth for a time. C. Braun has advised entire resection of such a septum. This was, however, not necessary in this case since the existing opening in the septum was easily enlarged by the examining finger.

Death in a child of ten weeks following an incomplete attempt at vomiting reported by Prof. Dr. Demme, of Bern, (*Wien. Med. bl.*, 12, '92). The child was fed on cow's milk and frequently vomited large masses of coagulated milk which had

*Translated for Medical and Surgical Reporter.

a sour odor. A mixture of Sod. Bicarb. 2:100 Ag. Dest. was ordered, a teaspoonful to each portion of milk. This produced the desired results, the vomiting ceased completely, whereupon the mother discontinued the medicine. One morning, however, she found the child dead. She had placed it into bed the night before apparently well after having fed it liberally on milk. The lips of the child were tightly clinched, of a dark bluish-red hue, cheeks and nails were bluish. An autopsie revealed the entire æsophagus up to its pharyngeal opening filled with a solid cheesy mass. This was also found pressing tightly against the epiglottis almost closing it hermetically. The pericardium and pleura were covered with numerous punctated hemorrhagic spots. All other organs were normal.

Without doubt the child strangulated in its efforts at vomiting. This to the author's mind, explains the cause of some of the sudden deaths without apparent reason, which so frequently appear in literature, and therefore thinks it wise to caution mothers to watch their children sometime after having fed them; and if efforts are made at vomiting to take it up and lay its breast over her arm and gently beat its back.

Phenolsalyl is a mixture of Acid Carbol. 9 parts, Acid Salicyl. 1 part, Acid Lactic 2 parts, Menthol 0, 1 part, dissolved by heat, soluble in glycerine, moderately so in water. This mixture was tried in Pasteur's institute and is supposed to possess greater antiseptic properties than the single ingredients. (*Deutsch. Med. Ziet.*, No. 98, 1892).

(*L'Un. Med.* 115, '92).

Supra pubic cystotomy in children. Dr. L. P. Alexandrow (*Archiv. of Klin. Chirurg.*, 41) reports twenty-six cases of sectio alta done in the last two years at the surgical department of St. Alga's Childrens' Hospital in Moskau. Of the twenty-six there were twenty-three done on children between the ages of two and a-half to seven years. Two were almost ten years and one five years. The operations are divided into three classes. The first class comprises two cases in which there was drainage from the bladder, complicated by fever, pyelites and hæmaturia. In the second class of sixteen cases the bladder was closed and the perivesical space was drained. Healing was complete between three to eighteen days. The third class embraces eight cases in which the entire wound was closed by the *etagennaht* or sectional suture. Of these eight cases, seven healed by first intention. One had vesical hemorrhage making it necessary to reopen the wound, and union was complete only after the 31st day. The materials used for sutures were silk and catgut.

Abstracts.

TAX ON QUACKS.

The recent suggestion of the Secretary of the Treasury that the tax on alcohol be increased fifty cents per gallon in order to raise more money for the increasing expenses of the Government seems to have met with a favorable response in some quarters, and the question of tariff and taxation will no doubt be considerably discussed by Congress in the near future.

In this connection the wisdom of putting a heavy and permanent tax on all forms of nostrums and quackery will at once commend itself to all wise legislators who are working for the public good. A stamp tax of this kind, say twenty-five per cent., on every form of secret or proprietary medicinal preparation of every kind, whether sold by the retailer, proprietor, manufacturer, or by advertising quack specialists, would be no hardship to the public, as it would in no wise affect the retail price of these articles. All such manufacturers could easily afford to give the Government twenty-five per cent. of the retail price and still have a very handsome profit left, as their net profit is rarely less than five hundred per cent., and often very much more.

Legitimate preparations of the Pharmacopœia and other standard preparations where the complete working formula is public property should be exempt. But as the success of quackery depends on secrecy and mystery, and as these two conditions enable unscrupulous persons to get a dollar for a few cents' worth of a simple remedy, it will be seen that there would be no injustice to any one if a good fair tax were put on the business.

If the Government went still further and required all nostrum and secret medicine manufacturers to pay a big license, and place on record open to public inspection a sworn statement of the exact composition, together with a complete working formula of each preparation, much good would result. And if, like insurance companies, they were also required to furnish heavy bonds or make a special deposit, which could be forfeited under proper restrictions, provided their medicine did not do all that was claimed for it, the public would be still better protected both in health and pocket, and no injustice would be done to the honest manufacturer of articles of real merit.

There is no good reason why the Government should not place the nostrum business on the same basis in its Internal Revenue Department as the manufacture of whiskey and tobacco. Analysis of these preparations should be made from time to time, and heavy penalties be imposed if they vary from the sworn formula on record, or if any dangerous drug like morphine is being used.

England, which is said to be a free trade country, taxes the nostrum business heavily, and derives a large and growing revenue from that source.—(To appear in January number of *New York Medical Times.*)

NERVOUS DISEASES IN LOW RACES AND STAGES OF CULTURE.

Among the errors which have been diligently disseminated by physicians who lacked ethnological information is that which claims that diseases of the nervous system, especially those of a hysterical character, have greatly increased with the development of civilization, and are most common in the races of highest culture.

Both assertions are erroneous. Those intelligent travellers who give the soundest information on this subject report that in uncultured nations violent and epidemic nervous seizures are very common. Castren describes them among the Siberic tribes. An unexpected blow on the outside of a tent will throw its occupants into spasms. The early Jesuit missionaries paint extraordinary pictures of epidemic nervous maladies among the Iroquois and Hurons. The Middle Ages witnessed scenes of this kind, impossible to-day.

In a late number of the *Journal de Medicine*, Paris, Dr. De la Tourette points out the frequency of true hysteria and hysteroid seizures in the Black race, among the Hottentots and Caffirs of East Africa, and among the natives of Abyssinia and Madagascar. They present frequent cases of classical hysterical attack and occasional epidemics of choreomania, affecting both sexes. A negress of the Soudan was lately a patient in the celebrated clinic of Dr. Charcot in Paris, and displayed the symptoms characteristic of neurosis. Civilization, so far from increasing this class of maladies, is one of the most efficient agents in reducing them in number and severity. When it is freed from certain elements not essential to it, especially religious excitement and competitive anxieties, it acts decidedly as a preventive.—Dr. Brinton, in *Science.*

Medical journals are the educators of medical men. As the California *Medical Journal* says, we know of nothing pertaining to medical literature, more interesting than the reading and comparison of medical journals. Some are devoted to surgery, some to medicine, some to hygiene, some to gynecology and some to all these various branches. In some we can see the careful diagnosis, the guarded prognosis and judicious treatment, begotten by years of painstaking conscientious work. Others are filled with the writings of enthusiastic theorists. In others we see the careful, conservative work of the experienced surgeon, and in others the work of the careless operators who are ever ready to operate, regardless of present conditions or future consequences. Any one who will read a half dozen different journals, and give their contents some thought may gain a valuable lesson not alone from the intrinsic value of each, but more especially from the comparison or contrasting of thought.—*Ex.*

NEWS AND MISCELLANY.

ALPHABET OF PROVERBS.

Denying a fault doubles it.
Knavery is the worst trade.
Foolish fear doubles danger.
Boasters are cousins to liars.
Richest is he that wants least.
Modesty is a guard to virture.
Upright walking is sure walking.
Quiet conscience is quiet sleep.
You never lose by doing a good act.
The boughs that bear most hang lowest.
He has hard work that has nothing to do.
One hour to-day is worth two to-morrow.
Envy shoots at others and wounds herself.
Zeal without knowledge is fire without light.
Proud looks make foul work in fair faces.
A grain of prudence is worth a pound of craft.
Learning makes a man fit company for himself.
Confession of a fault makes half amends.
Not to hear conscience is the way to silence it.
Virture and happiness are mother and daughter.
It costs more to revenge wrongs than to suffer them.
Wise men make more opportunities than they find.
Small faults indulged are little thieves that let in greater ones.—*The Tex. Health Jour.*

PERFUMES AND THE SENSE OF SMELL.

The olfactory sense is followed by effects of different kinds of intensity from those of sight and hearing, and may be accompanied by a kind of poisoning. The old medical books are full of stories of it. There are those of a girl killed by the exhalations of violets; of a woman seized with a violent headache from sleeping on a bed of roses; and of a girl who lost her voice by smelling of a bouquet. Ancient medicine attributed curative properties to perfumes, particularly to those of the rose, musk, and benzoin. The intensity of the effects of perfumes makes a rapid succession of sensations almost impossible, for consecutive odors cause a rapid anæsthesia of the senses; on the other hand, if the times separating two successive sensations are too long, it becomes impossible to combine them, and the anticipated effect is disturbed by strange feelings. In short, smell is rather the complement of other excitation like a melody or a picture. Its function is, nevertheless, very important. By virtue of its volatility it is a valuable prophylactic; by the great intensity of its effects it can bring about salutary modifications of physiological functions, particularly of the amplitude of respiration; and it possesses in the highest degree the luxurious character of every artistic enjoyment. Flavor has an essential part in nutrition; so has touch. Hearing and sight are indispensable to relation with other persons; but smell, necessary to the animal for finding its prey and avoiding danger, has become, under normal conditions, an almost useless sense to man, since the refinements of civilization tend to prevent the production of miasms and the pestilential odors from which he has to protect himself. It is therefore becoming more and more a sense of luxury for civilized man; and that perhaps, is the reason why poets, from the author of the Song of Songs down, have associated all kinds of beauty and joy with perfumes.—*Popular Science Monthly.*

The milk in the cocoanut may be extracted from the following occurring in an article by Dr. N. G. Whipple (Kansas City *Med. Rec.*): A strong point in the code is that physicians avoid giving publicity to their cases through the papers. In most of the appall.—*Med. Rev.*

BOOKS RECEIVED.

[In sending books for notice in the REPORTER, publishers are requested, for the information of the reader, as well as for their own advantage, to give the price. This announcement by title will be followed, in most cases, by a review, which will appear at the earliest opportunity.]

Hygienic Measures in Relation to Infectious Diseases. By George H. F. Nutall, M. D., Ph. D., (Gottengen). New York and London: G. P. Putman's Sons, 1893. Price, 75 cents.

Manual of Practical Medical and Physiological Chemistry. By Charles E. Pellew, E. M. New York: D. Appleton & Co., 1892. Price $2.50.

Materia Medica, Pharmacy, Pharmacology and Therapeutics. By W. Hale White, M. D., F. R. C. P. Edited by Reynold W. Wilcox, M. A., M. D., LL. D. Philadelphia: P. Blakiston & Co., 1012 Walnut St., 1892. Price $3.00.

The Anatomy of the Peritoneum. By Franklin Dexter, M. D. D. Appleton & Co., 1892.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds.

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

UNIVERSITY OF MARYLAND.—SCHOOL OF MEDICINE

The Eighty-Sixth Annual Session will begin October 1st, 1892, and will end in April, 1893. Didactic lectures are illustrated by daily clinical instruction in general medicine and surgery, and the various special branches. Laboratory instruction in chemistry and normal pathological histology. All candidates for graduation have personal experience in practical obstetrics.

For further information and circular apply to

I. E. ATKINSON, M. D., Dean,
605 Cathedral Street, Baltimore.

VACCINE MATTER.

For the accommodation of our Subscribers, we will supply both Bovine and Humanized Vaccine Virus.

Guaranteed to be fresh and in every respect first class.

PRICES:

Bovine Crusts, - - -	**$1 50 each**
Bovine Points or Quills, -	**1.00 a dozen.**
Humanized Crusts, - -	**1.00, small.**
Humanized Crusts, - -	**2.00, large.**

The Humanized Crusts are warranted to be from typical cases, and in every instance from healthy children, with unquestionable family histories.

PLEASE ACCOMPANY THE ORDER WITH THE MONEY.

Address, The Butler Publishing Company,
P. O. Box 843 PHILADELPHIA.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

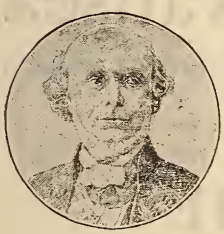
A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.



M. De Quatrefages.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentat on of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

TONIC ACTION
ON
STOMACH AND
BOWELS

(Name) SHARP & DOHME, MANUFACTURING CHEMISTS ESTABLISHED 1860 Baltimore, Md.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

Mellin's Food

FOR INFANTS AND INVALIDS.

A SOLUBLE DRY EXTRACT, prepared from Malted Barley and Wheat, consisting of Dextrin, Maltose, Albuminates, and Salts.

The SUGAR in MELLIN'S FOOD is MALTOSE. MALTOSE is the PROPER SUGAR for use in connection with cow's milk.

The sugar formed by the action of the Ptyalin of the Saliva and the Amylopsin of the Pancreas upon starch is MALTOSE. In the digestive tract MALTOSE is absorbed UNCHANGED.

—*Landois and Sterling.*

MALTOSE is a saccharose, not a glucose, and is a form of sugar which does not ferment.

—*Materia Medica and Therapeutics, Dr. Mitchell Bruce.*

"I have never seen any signs of fermentation which I could attribute to the influence of MALTOSE."

—*Eustace Smith, M.D., F.R.C.S.*

MELLIN'S FOOD, prepared according to the directions, is a true LIEBIG'S FOOD and the BEST SUBSTITUTE for Mother's Milk yet produced.

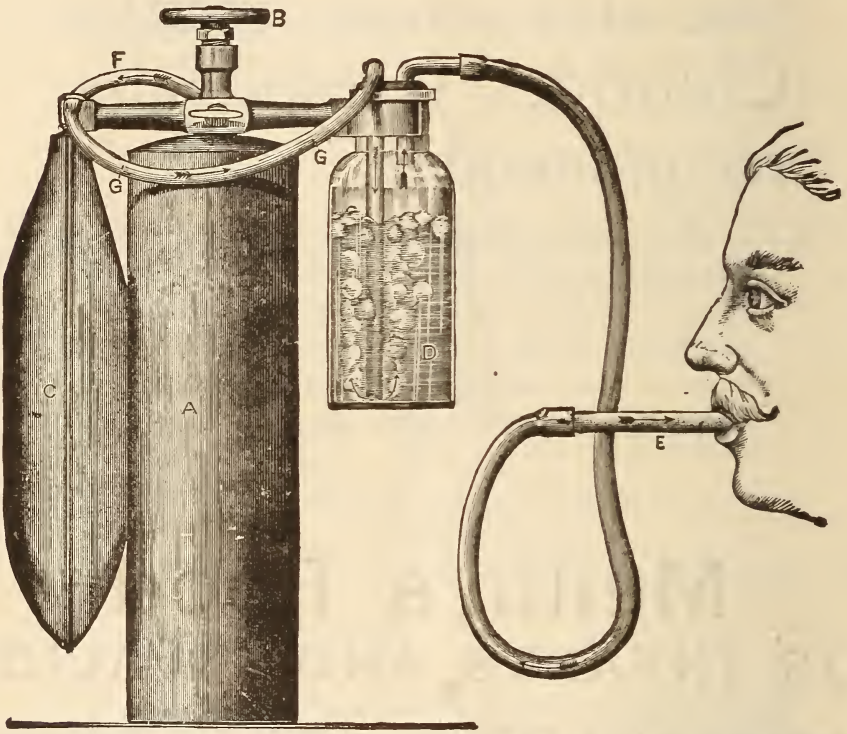
IT REQUIRES NO COOKING.

THE DOLIBER-GOODALE CO.,
BOSTON, MASS.

INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.,

PHILADELPHIA, NEW YOYK, BOSTON, CHICAGO, BROOKLYN, ATLANTA.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

PREFERABLE TO CORROSIVE SUBLIMATE

Because it is not poisonous

Because it possesses superior antiseptic properties

Because it forms no insoluble compounds with the animal fluids

Because it produces no pain or irritation even of abraded surfaces

For use in all cases and under all circumstances where CORROSIVE SUBLIMATE has hitherto been employed

APPLICABLE WHEREVER AN ANTISEPTIC IRRIGATION or Lotion is indicated and as a Prophylactic and Disinfectant under any and all circumstances

CHLORO PHÉNIQUE

PERFECTLY MISCIBLE WITH WATER

For washing out the cavities, or THE BLADDER IN CHRONIC CYSTITIS it has no equal

A Non-Irritant Non-Poisonous Antiseptic and Parasiticide of Great Energy

In FOUL WOUNDS, ABSCESSES, SUPPURATING SINUSES, BUBOES, etc., CHLORO-PHÉNIQUE is used to cleanse and to prepare the way for "Campho-Phénique," which latter as a permanent dressing, subdues pain, prevents the formation of pus, and hastens healing in a remarkable manner

PHENIQUE CHEMICAL COMPANY

2715 CASS AVENUE - - - ST. LOUIS, MO.

Wood's Nervous Diseases and Their Diagnosis, - - -	4.00
	$9.00

Nervous Diseases and Their Diagnosis

By H. C. WOOD, M. D., LL. D.,

Professor of Therapeutics and Nervous Diseases, University of Pennsylvania.
8vo., pp. 501, Cloth, $4.

It is invaluable as a work of diagnosis.—*Virginia Medical Monthly.*

It is at once a substantive contribution to neurology and a trustworthy guide to what has already been done in the subject.—*Practitioner.*

As a whole, the work is one which cannot fail to be of great service to the practicing physician.—*Medical and Surgical Reporter.*

The volume is a distinct help to the student, and is a necessary supplement to the systematic works on diseases of the nervous system.—*Boston Med. Surg. Jour.*

The author's originality is evident to every reader of his work; and we trust, for the advancement of knowledge, his readers will be many.—*New England Med. Gaz.*

This work fills a long-felt need in this department.—*Buffalo Med. Surg. Jour.*

Dr Wood is an able clinician, and this makes his book valuable. His observations are practical and to the point and show careful study of a large number of cases which have fallen under his care.—*N. Y. Med. Jour.*

The honest effort of one who never writes without teaching and who always writes and teaches well.—*Journal of Insanity.*

To students and practitioners who have read other works this production will prove extremely valuable in time of need, to the former just before examination; to the latter in everyday practice.—*London Lancet.*

Not a compilation, but rather the record of independent opinions and investigations.—*Canadian Practitioner.*

The book is written in the characteristic vigorous style of its able and versatile author —*American Practitioner.*

Lucid language, clear type, a full index, and, above all, the presentation of the late advances in this department of science, constitute the truly great attractions of this book.—*Albany Med. Annals.*

It is not until the volume has been carefully read, and perhaps re-read, that its true excellence begins to dawn upon the reader.—*Maryland Med. Journal.*

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. SPASMODIC. INTERMENSTRUAL. NEURALGIC. EMBRANOUS. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. PALATABLE. EFFICIENT

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

WESTERN PENNSYLVANIA MEDICAL COLLEGE
CITY OF PITTSBURGH.
SESSIONS OF 1892.

The REGULAR SESSION begins on the last Tuesday of September, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,
HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

T. D. CROTHERS, M. D.,
Sup't Walnut Lodge, Hartford, Conn.

DR. MASSEY'S
PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

A VALUABLE AGENT.

APOLLINARIS "The Queen of Table Waters"

"I can recommend it in the strongest terms. Of great value in cases of acid stomach."

LEWIS A. SAYRE, M. D.

Professor of Orthopedic Surgery in Bellevue Hospital Medical College: Surgeon to Bellevue Hospital, etc.

"Light, sparkling, and easy of digestion."

FORDYCE BARKER, M. D.

Professor of Clinical Midwifery and Diseases of Women in Bellevue Hospital Medical College: Surgeon of the New York State Woman's Hospital, etc.

"Healthful as well as agreeable. Well suited for Dyspeptics."

AUSTIN FLINT, M. D.

Professor of the Principles and Practice of Medicine and Clinical Medicine in Bellevue Hospital Medical College: Visiting Physician to Bellevue Hospital, etc.

"Every case of Typhoid Fever is a case of water poisoning. This is a useful item for the public to keep in mind."

NEW YORK MEDICAL RECORD.

January 9th, 1892.

"The PURITY of APOLLINARIS offers the best SECURITY against the DANGERS which are common to most of the drinking waters."

LONDON MEDICAL RECORD.

AN IDEAL PEPSIN!

PHYSICIANS PRESCRIBE

P., D. & CO.'S

ASEPTIC PEPSIN.

Pepsins as heretofore known have left very much to be desired, most of them indicating by their odor the putrescent mucus and other objectionable constituents which must necessarily prove irritating, especially to the delicate stomach of an infant, invalid or dyspeptic.

We now supply a new and improved Pepsin Product (ASEPTIC PEPSIN, 1 to 4000, P., D. & Co.'s), in the full confidence that it will at once recommend itself to the favorable attention of the Medical Profession.

It is twice as active as any other pepsin now on the market, and by the process of manufacture which we pursue, is deprived of all septic constituents. This process renders it very palatable so that the most fastidious palate could not possibly object to its taste.

Samples and literature will gladly be supplied upon application.

MANUFACTURED ONLY BY

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK AND KANSAS CITY.

FRELIGH'S TABLETS,

(Cough and Constituent),

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{60}$ gr.), Atropiæ Sulph. ($\frac{1}{100}$ gr.), Codeia ($\frac{1}{10}$ gr.), Antimony Tart. ($\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis, fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{10}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of th profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that th applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double) boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address.

I. O. WOODRUFF & CO.,

MANUFACTURERS OF PHYSICIANS' SPECIALTIES,

36 Maiden Lane, **New York City.**

Saliva changes Starch Foods to Dextrine & Sugar.

Gastric Juice ... Proteids (Meat, Egg, &c) to Peptone in acid medium.
Milk. Casein Curdled.

Pancreatic Juice ... Proteids (Meat, Egg, Milk, &c) to Peptone in alkaline or neutral medium.
Milk Casein Curdled.
Starch Foods to Dextrine & Sugar.
Fats Emulsified.

Papoid gives the combined action of Saliva, Gastric & Pancreatic Juice.

Digests all kinds of Food. Acts under all conditions.
Acts all the time the food is in the body.
Is a tonic to the digestive organs.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1**;" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S*," viz., "*Ext. Carnis Fl. Comp. (Colden.)*" A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

C. N. CRITTENTON, General Agent, 115 Fulton St., New York.

GLENN'S SULPHUR SOAP.

BEWARE OF COUNTERFEITS.

Physicians know the great value of the local use of Sulphur in the **Treatment of Diseases of the Skin.**

Constantine's Pine-Tar Soap.

THE BEST SOAP MADE.

Has been on trial among physicians for very many years as a healing agent. By far the Best Tar Soap made.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton St, New York.

Samples of above Soaps SENT FREE, on application, to any Physician enclosing card.

ALE AND BEEF "PEPTONIZED" EXTRACT BOVIS-CUM-MALTO

"It is a great Builder without a doubt."—W. C. Wile, A. M., M. D., Danbury.
"I get better results from it than from any other nutrient."—Wm. Porter, M.D., St. Louis.
"It is an essential and admirable remedy in exhaustive stages of diseases."—S. D. Richards, M. D., Detroit.
"I endorse it as a real food of great value."—E. Chancellor, M. D., St. Louis.
"It has more virtues than you claim for it."—James P. Prestley, M. D., Chicago.

Two Bottles sent to any Physician who will pay Express charges.

THE ALE AND BEEF COMPANY, Dayton, Ohio.

"Orders from all parts of the Dominion of Canada supplied by The Canadian Peptonized Beef & Ale Co., Limited, 153 Hollis Street, Halifax, N. S."

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid acid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach

---

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Particularly applicable to conditions of **mal-nutrition.**

A reliable **tonic in convalescence** from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in **glandular enlargements, scrofulosis, imperfect bone formation** or **impairment of the central nervous system.** An easily appropriated and stable combination of the soluble **Wheat Phosphates** with **Muriate of Quinine, Iron** and **Strychnia.**

Of greater strength than the Various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince Street, New York.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

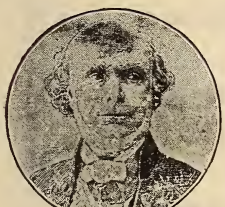
A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.



M. De Quatrefages.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentat on of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chrysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency. Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria. Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRI' CORDIAL is Indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

RIO CHEMICAL CO., St. Louis, Mo., U. S. A.

LONDON. PARIS. CALCUTTA. MONTREAL.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

Mellin's Food

FOR INFANTS AND INVALIDS.

A SOLUBLE DRY EXTRACT, prepared from Malted Barley and Wheat, consisting of Dextrin, Maltose, Albuminates, and Salts.

The SUGAR in MELLIN'S FOOD is MALTOSE. MALTOSE is the PROPER SUGAR for use in connection with cow's milk.

The sugar formed by the action of the Ptyalin of the Saliva and the Amylopsin of the Pancreas upon starch is MALTOSE. In the digestive tract MALTOSE is absorbed UNCHANGED.

— Landois and Sterling.

MALTOSE is a saccharose, not a glucose, and is a form of sugar which does not ferment.

— Materia Medica and Therapeutics, Dr. Mitchell Bruce.

"I have never seen any signs of fermentation which I could attribute to the influence of MALTOSE."

— Eustace Smith, M.D., F.R.C.S.

MELLIN'S FOOD, prepared according to the directions, is a true LIEBIG'S FOOD and the BEST SUBSTITUTE for Mother's Milk yet produced.

IT REQUIRES NO COOKING.

THE DOLIBER-GOODALE CO.,

BOSTON, MASS.

GASTRIC DERANGEMENTS

HORSFORD'S ACID PHOSPHATE

Unlike all other forms of phosphorus in combination, such as dilute phosphoric acid, glacial phosphoric acid, neutral phosphate of lime, hypophosphites, etc., the phosphates in this product are in solution, and readily assimilated by the system, and it not only causes no trouble with the digestive organs, but promotes in a marked degree their healthful action.

In certain forms of dyspepsia it acts as a specific.

Dr. T. G. COMSTOCK, of the Good Samaritan Hospital, St. Louis, says: "For some years we have used it in a variety of derangements characterized by debility, as also in chronic gastric ailments. It is approved of, unanimously, by the medical staff of this Hospital."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Prepared under the direction of Prof. E. N. HORSFORD, by the

Rumford Chemical Works, Providence, R. I.

SVAPNIA

OR

PURIFIED OPIUM

FOR PHYSICIANS USE ONLY.

Contains the Anodyne and Soporific Alkaloids, Codeia, Narceia and Morphia.

Excludes the Poisonous and Convulsive Alkaloids, Thebaine, Narcotine and Papaverine.

SVAPNIA has been in steadily increasing use for over twenty years, and whenever used has given great satisfaction.

To PHYSICIANS OF REPUTE, not already acquainted with its merits, samples will be mailed on application.

SVAPNIA is made to conform to a uniform standard of Opium of Ten per cent. Morphia strength.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. PALATABLE. EFFICIENT

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

WESTERN PENNSYLVANIA MEDICAL COLLEGE
CITY OF PITTSBURGH.

SESSIONS OF 1892.

The REGULAR SESSION begins on the last Tuesday of September, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,
HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

T. D. CROTHERS, M. D.,
Sup't Walnut Lodge, Hartford, Conn.

DR. MASSEY'S
PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.

EDWARD T. REICHERT, M. D., Professor of Physiology.

WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.

36th and Woodland Avenue, Philadelphia.

THIS IS A BUSY WORLD—

your's a busy profession—"MERCK'S BULLETIN," a practical magazine for busy men. Of medical and surgical magazines there is no end. Our success is due to our distinctiveness. We sift the chaff from the wheat. We epitomize the field. What you want to know is here; what you don't want to know has been omitted. "Merck's Bulletin" is indispensable to a progressive physician. It is learned, it is authoritative, it is practical. It is independent. It keeps the higher planes of pure, scientific medication boldly to the front. It furnishes new and practical methods for controlling disease. It is the first recorder of new discoveries.

Subscriptions $2.00 per year. *Sample copy free.*

FRELIGH'S TABLETS,

(Cough and Constituent),

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{50}$ gr.), Atropiæ Sulph. ($\frac{1}{100}$ gr.), Codeia ($\frac{1}{50}$ gr.), Antimony Tart. $\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis. fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{50}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of the profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that the applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double) boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

Chemists. N.Y.

A REFRESHING TONIC AND RECONSTRUCTIVE.

While the most prominent use for the Hypophosphites of Lime and Soda is in the treatment of Consumption and Scrofula, in which its tonic and tissue-building properties render it particularly efficacious, yet it has other and quite varied uses, based upon these same properties. One of the most marked of these is its use as a tonic reconstructive in hot weather.

Many persons have fair health during the cooler months of the year, yet suffer greatly from debility during the long, hot summer. The relaxing effects of the heat itself, besides the loss of the salts of the tissues, through the excessive colliquative perspiration, prove exceedingly depressing to the vital powers. Not only is this condition of extreme debility very depressing in itself, but it also predisposes the victims to attacks of disease which they would otherwise be able to resist. Thus during the heated term, we have a long list of protracted, exhaustive fevers, for the fatal issue of which the extreme debility of the patients is largely responsible.

In all this we may see another demonstration of the value of the phosphorus salts of lime and soda as tonic and vitalizing agents in the animal economy, and also a definite clue to the proper remedy for the condition described, as these tissue-salts are largely wasted in excessive perspiration. This remedy is the pure Hypophosphites of Lime and Soda. By its tonic properties, refreshing, revitalizing and invigorating the entire system, it restrains the excessive perspiration, and the consequent waste is checked. But it also furnishes the system with healthy tissue-food to replace with new and vigorous cells the necessary waste incident to the ordinary physiological processes. Thus the system is kept all the time up to a prime condition of physical strength and mental exhilaration, and germs of disease find little encouragement for invasion.

It would be advisable that those who "do not bear hot weather well" should resort each year to a course of the Hypophosphites of Lime and Soda, and thus fortify the system against *certain* exhaustion and *possible* malignant disease.

Direct them to put a teaspoonful of McArthur's Syrup occasionally in a glass of cold water, as a drink, and the "insatiable thirst" will be more easily relieved. Recommend this also, to your consumptive and scrofulous patients, and those afflicted with diseases characterized by exhausting discharges and great debility, and they will report the summer as the most refreshing season they have ever passed. The McArthur Hypophosphite Co., Boston, Mass., will send upon request to any physician not familiar with McArthur's Syrup, a full sized bottle, by express, without expense, save the express charge; also, interesting matter about the value and uses of the Hypophosphites.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

52 West 15th Street, New York.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.

EDWARD T. REICHERT, M. D., Professor of Physiology.

WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.

BARTON COOKE HIRST, M. D., Professor of Obstetrics.

J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.

JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.

GEORGE A. PIERSOL, M. D., Professor of Anatomy.

JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.

LOUIS A. DUHRING, M. D., Professor of diseases of the skin.

JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Geromorphism

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

AN IDEAL PEPSIN!

PHYSICIANS PRESCRIBE

P., D. & CO.'S

ASEPTIC PEPSIN.

Pepsins as heretofore known have left very much to be desired, most of them indicating by their odor the putrescent mucus and other objectionable constituents which must necessarily prove irritating, especially to the delicate stomach of an infant, invalid or dyspeptic.

We now supply a new and improved Pepsin Product (ASEPTIC PEPSIN, 1 to 4000, P., D. & Co.'s), in the full confidence that it will at once recommend itself to the favorable attention of the Medical Profession.

It is twice as active as any other pepsin now on the market, and by the process of manufacture which we pursue, is deprived of all septic constituents. This process renders it very palatable so that the most fastidious palate could not possibly object to its taste.

Samples and literature will gladly be supplied upon application.

MANUFACTURED ONLY BY

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK AND KANSAS CITY.

ERGOTOLE S & D's

is a Concentrated (2½ grs. of select Spanish Ergot to each minim)

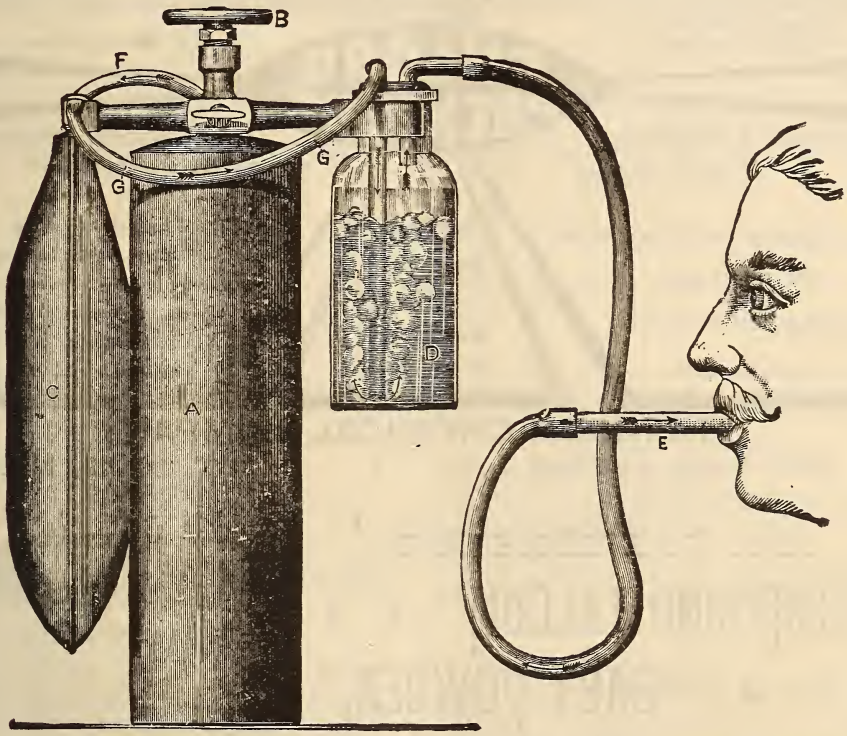
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.

PHILADELPHIA, NEW YOYK, BOSTON, CHICAGO, BROOKLYN, ATLANTA.

PREFERABLE TO CORROSIVE SUBLIMATE

Because it is not poisonous

Because it possesses superior antiseptic properties

Because it forms no insoluble compounds with the animal fluids

Because it produces no pain or irritation even of abraded surfaces

For use in all cases and under all circumstances where

CORROSIVE SUBLIMATE

has hitherto been employed

APPLICABLE WHEREVER AN ANTISEPTIC IRRIGATION or Lotion is indicated and as a Prophylactic and Disinfectant under any and all circumstances

CHLORO PHENIQUE

PERFECTLY MISCIBLE WITH WATER

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority; this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

WESTERN PENNSYLVANIA MEDICAL COLLEGE
CITY OF PITTSBURGH.
SESSIONS OF 1892.

The REGULAR SESSION begins on the last Tuesday of September, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,
HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.--

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil	80 m. (drops)	Soda	1-3 Grains
Distilled Water	35 "	Salicylic Acid	1-4 "
Soluble Pancreatin	5 Grains.	Hyocholic Acid	1-20 "

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which HYDROLEINE is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

C. N. CRITTENTON,

SOLE AGENT FOR THE UNITED STATES. 115 FULTON STREET, N. Y.

A Sample of Hydroleine will be sent free upon application, to any physician (enclosing business card) in the U. S.

Farbenfabriken vorm. Friedr. Bayer & Co.'s
Pharmaceutical Specialties

PHENACETINE=BAYER

Antipyretic
Analgesic, or
Anodyne

PHENACETINE-BAYER IS A TRUE AND DISTINCT ORGANIC DERIVATIVE, not a mechanical mixture. It is indicated in influenza (la grippe), in all fevers, with or without pain, rheumatism and rheumatoid maladies, neuralgia, bronchitis, phthisis, pertussis, and the gastralgias. Phenacetine-Bayer acts promptly, and is both safe and effective. It is supplied in ounces, tablets and pills.

SULFONAL=BAYER

Hypnotic
Antineurotic
Nerve Sedative

INSOMNIA OF ALL KINDS YIELDS PROMPTLY TO SULFONAL-BAYER. It is useful in simple insomnia and in the cerebral disturbances of insanity. It is a pure hypnotic, a safe and effective remedy, and it does not give rise to a drug habit. As its action is slower than that of the narcotics, it must be administered properly (*see pamphlet*). Sulfonal-Bayer is supplied in ounces, tablets and pills.

EUROPHEN

(A CRESOL=IODIDE IODOFORM SUBSTITUTE)

Antiseptic
Antisyphilitic
Local Stimulant

AS A SUBSTITUTE FOR IODOFORM, Europhen is winning an enviable place in therapeutics. It has a special value in specific lesions; while as a surgical dressing in ulceration, open wounds, and septic conditions of the cavities, it has given excellent results. It is supplied in ounces. Europhen-Aristol, a combined product consisting of equal parts of each medicament, is also supplied in ounces.

ARISTOL

(A THYMOL=IODIDE IODOFORM SUBSTITUTE)

Antisuppurative
Antiseptic
Cicatrisant

THE VALUE OF ARISTOL in all the morbid conditions formerly treated by iodoform is widely recognized. In all external traumatisms, in cavital lesions and in many of the dermatoses it has given very satisfactory results. As a surgical application, it is safe, inodorous and non-toxic. Aristol is supplied in ounces. Europhen-Aristol, a preparation consisting of equal parts of each medicament, is also supplied in ounces.

DESCRIPTIVE PAMPHLETS FORWARDED ON APPLICATION.

W. H. Schieffelin & Co., New York.

"COMING OUR WAY."

THE WM. S. MERRELL CHEMICAL CO., are the original, the largest and practically the ONLY manufacturers of True Salicylic Acid from Natural Wintergreen Oil; and the lack of faith—amounting to practical unbelief—in the necessity for careful specification, has enabled unprincipled or incompetent makers to market their product and supply that class of buyers who believe in something "cheap," especially if assured by interested distributors that "it is just as good."

READ THIS!

A Salicylic Uncertainty.

A warning key-note struck by an unprejudiced and disinterested writer in favor of high qualities and positive therapeutics.

The fact that a synthetic chemical gives reactions apparently identical with its native prototype does not establish indentity of physiological action. Even the natural alkaloid caffeine has been shown by clinical experiment to differ in its action when derived from different plants.

Charteris and others have shown that salicylic acid obtained from oil of wintergreen differs in its therapeutic effects from that made by synthesis, and physicians sometimes insist on having the former kind, which is much more expensive.

But artificial oil of wintergreen has become quite common. It is made by combining artificial salicylic acid with the methyl radical of methyl alcohol. Now, it is said that certain manufacturers have adopted the idea of using this artificial oil for the production of salicylic acid; that is, they juggle with what remnants of conscience they may have, by taking artificial salicylic acid out of a compound into which they or somebody else has put it, and calling this "acid from the oil."

This circumstance will lead to confusion as to the real source of a given salicylic acid and we regret to have to admit that there are probably some dealers who will resort to the subterfuge of supplying "acid from the oil," when they know that the oil was not the natural product. So where such acid is desired, the pharmacist must demand of his dealer a guarantee extending to the oil itself.

Editorial Druggist's Circular,
May, 1892.

The best dispensers always specify "MERRELL'S."

True Salicylic Acid } From Natural
True Salicylate Sodium } Wintergreen Oil.

The **"Merrell Co."** do not sell, use or handle Synthetic Oil Wintergreen or acid made from it.

The **"Merrell Co."** do not "rub up" Commercial Salicylic Acid with a little Oil Wintergreen and call it Salicylic Acid from Wintergreen Oil, and recommend the "light feathery crystals" thus produced as the "proper thing."

The **"Merrell Co."** do not claim that True Salicylic Acid has "a slight odor of the oil"—for when pure and properly prepared, it has an odor peculiarly its own, but it is not a Wintergreen odor.

Crystals of True Salicylic Acid are large, firm and hard—from ¼ to ¾ inch long, of measurable thickness, and much heavier in a given bulk than acid prepared "in a mortar" from Synthetic Oil and Commercial Acid.

THE WM. S. MERRELL CHEMICAL CO.

NEW YORK. BOSTON. CINCINNATI.

OR MAY BE ORDERED THROUGH WHOLESALE DRUGGISTS IN ANY PROMINENT DISTRIBUTING CENTRE.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

J. Millner Fother.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong anti-eptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success Chrysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

GLYCOZONE.

PREVENTS FERMENTATION OF FOOD IN THE STOMACH.
MOST POWERFUL REMEDY FOR HEALING PURPOSES. CURES:
DYSPEPSIA, GASTRITIS, ULCER OF THE STOMACH, HEART-BURN.

Send for free book of 80 pages giving articles by contributors to medical literature.
PHYSICIANS WILLING TO PAY EXPRESS CHARGES WILL RECEIVE FREE SAMPLE ON APPLICATION.
Glycozone is sold only in 4 ounce, 8 ounce, and 16 ounce bottles. Never sold in bulk.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

UNIVERSITY OF MARYLAND—SCHOOL OF MEDICINE
BALTIMORE, MD.

DR. WM. T. HOWARD,

Professor of Diseases of Women and Children in the University of Maryland, says:

After comparing the water of **SPRING NO. 1** with that of a very celebrated water

"Indeed, in a certain class of cases, it is much superior to the latter. I allude to the abiding debility attendant upon the tardy convalescence from grave acute diseases, and more especially to the Cachexia and Sequelæ incident to Malarious Fevers in all their grades and varieties, to certain forms of Atonic Dyspepsia and

All the Affections Peculiar to Women

that are remediable at all by mineral waters. In short, were I called upon to state from what Mineral Waters I have seen the greatest and most unmistakable amount of good accrue in the largest number of cases in a general way, I would unhesitatingly say the Buffalo Springs, in Mecklenburg County, Virginia."

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

BUFFALO LITHIA SPRINGS, VA.

"COMPOUND TALCUM" * * * * "BABY POWDER,"

THE

"HYGIENIC DERMAL POWDER"

FOR

INFANTS AND ADULTS.

Introduced to the Medical and the Pharmaceutical professions by J. FEHR, in the year 1873.

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER BOX, PLAIN, 25 Cents; PERFUMED, 50 Cents.
PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

SOLD BY THE DRUG TRADE GENERALLY.

MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, **HOBOKEN, N. J.**

Only advertised in Medical and Pharmaceutical prints.

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. SPASMODIC. INTERMENSTRUAL. NEURALGIC. MEMBRANOUS. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. PALATABLE. EFFICIENT

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free Iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

Western Pennsylvania Medical College.

Medical Department of the Western University of Pennsylvania.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

T. D. CROTHERS, M. D.,
Sup't Walnut Lodge, Hartford, Conn.

DR. MASSEY'S

PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

212 S. Fifteenth St., Philadelphia.

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of diseases of the skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

Nervous Diseases and Their Diagnosis

By H. C. WOOD, M. D., LL. D.,

Professor of Therapeutics and Nervous Diseases, University of Pennsylvania.
8vo., pp. 501, Cloth, $4.

It is invaluable as a work of diagnosis.—*Virginia Medical Monthly.*

It is at once a substantive contribution to neurology and a trustworthy guide to what has already been done in the subject.—*Practitioner.*

As a whole, the work is one which cannot fail to be of great service to the practicing physician.—*Medical and Surgical Reporter.*

The volume is a distinct help to the student, and is a necessary supplement to the systematic works on diseases of the nervous system.—*Boston Med. Surg. Jour.*

The author's originality is evident to every reader of his work; and we trust, for the advancement of knowledge, his readers will be many.—*New England Med. Gaz.*

This work fills a long-felt need in this department.—*Buffalo Med. Surg. Jour.*

Dr. Wood is an able clinician, and this makes his book valuable. His observations are practical and to the point and show careful study of a large number of cases which have fallen under his care.—*N. Y. Med. Jour.*

The honest effort of one who never writes without teaching and who always writes and teaches well.—*Journal of Insanity.*

To students and practitioners who have read other works this production will prove extremely valuable in time of need, to the former just before examination; to the latter in everyday practice.—*London Lancet.*

Not a compilation, but rather the record of independent opinions and investigations.—*Canadian Practitioner.*

The book is written in the characteristic vigorous style of its able and versatile author.—*American Practitioner.*

Lucid language, clear type, a full index, and, above all, the presentation of the late advances in this department of science, constitute the truly great attractions of this book.—*Albany Med. Annals.*

It is not until the volume has been carefully read, and perhaps re-read, that its true excellence begins to dawn upon the reader.—*Maryland Med. Journal.*

FRELIGH'S TABLETS,

(Cough and Constituent),

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{30}$ gr.), Atropiæ Sulph. ($\frac{1}{300}$ gr.), Codeia ($\frac{1}{10}$ gr.), Antimony Tart. $\frac{1}{15}$ gr.), Ipecac, Aconite, Pulsatilla. Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis. fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{30}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of th profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that th applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double, boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

Chemists. N.Y.

A REFRESHING TONIC AND RECONSTRUCTIVE.

While the most prominent use for the Hypophosphites of Lime and Soda is in the treatment of Consumption and Scrofula, in which its tonic and tissue-building properties render it, particularly efficacious, yet it has other and quite varied uses, based upon these same properties. One of the most marked of these is its use as a tonic reconstructive in hot weather.

Many persons have fair health during the cooler months of the year, yet suffer greatly from debility during the long, hot summer. The relaxing effects of the heat itself, besides the loss of the salts of the tissues, through the excessive colliquative perspiration, prove exceedingly depressing to the vital powers. Not only is this condition of extreme debility very depressing in itself, but it also predisposes the victims to attacks of disease which they would otherwise be able to resist. Thus during the heated term, we have a long list of protracted, exhaustive fevers, for the fatal issue of which the extreme debility of the patients is largely responsible.

In all this we may see another demonstration of the value of the phosphorus salts of lime and soda as tonic and vitalizing agents in the animal economy, and also a definite clue to the proper remedy for the condition described, as these tissue-salts are largely wasted in excessive perspiration. This remedy is the pure Hypophosphites of Lime and Soda. By its tonic properties, refreshing, revitalizing and invigorating the entire system, it restrains the excessive perspiration, and the consequent waste is checked. But it also furnishes the system with healthy tissue-food to replace with new and vigorous cells the necessary waste incident to the ordinary physiological processes. Thus the system is kept all the time up to a prime condition of physical strength and mental exhilaration, and germs of disease find little encouragement for invasion.

It would be advisable that those who "do not bear hot weather well" should resort each year to a course of the Hypophosphites of Lime and Soda, and thus fortify the system against *certain* exhaustion and *possible* malignant disease.

Direct them to put a teaspoonful of McArthur's Syrup occasionally in a glass of cold water, as a drink, and the "insatiable thirst" will be more easily relieved. Recommend this also, to your consumptive and scrofulous patients, and those afflicted with diseases characterized by exhausting discharges and great debility, and they will report the summer as the most refreshing season they have ever passed. The McArthur Hypophosphite Co., Boston, Mass., will send upon request to any physician not familiar with McArthur's Syrup, a full sized bottle, by express, without expense, save the express charge; also, interesting matter about the value and uses of the Hypophosphites.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Paracelsus.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G. T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

"The PURITY of APOLLINARIS offers the best SECURITY against the DANGERS which are common to most of the drinking waters."

LONDON MEDICAL RECORD.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

ERGOTOLE S & D's

is a Concentrated (2½ grs. of select Spanish Ergot to each minim)
Purified (all inert and irritating matter is removed)
Permanent (it *keeps* perfectly without deterioration)
Preparation of Ergot that

Does not Produce Nausea

when given by the mouth, and does not produce irritation or abscess when exhibited *hypodermically*.

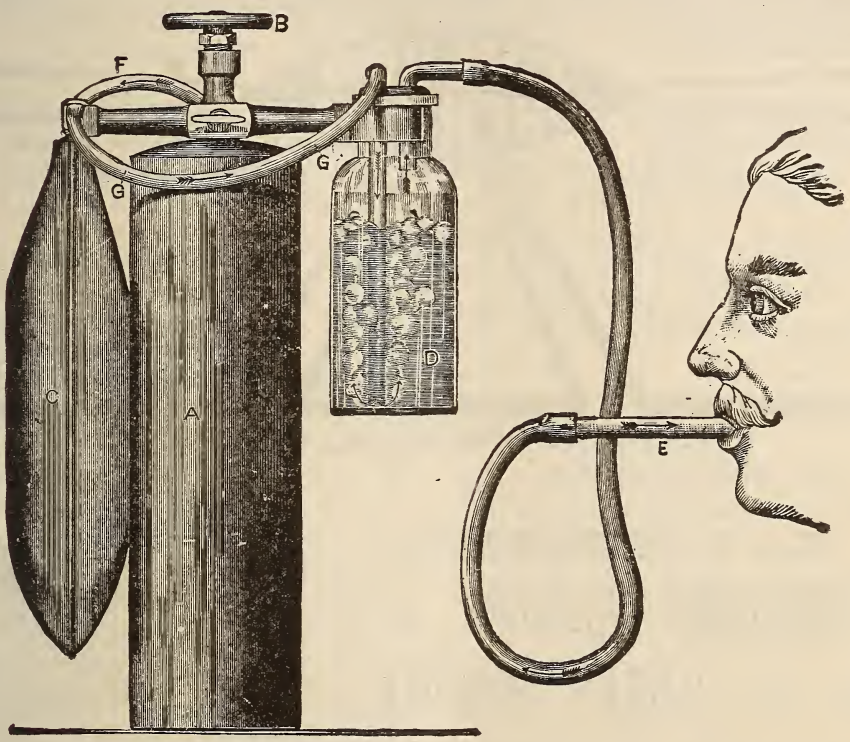
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.,

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup **will not decompose**, and the danger (so common to other like preparations) of administering a preparation of **free iodine**, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

Western Pennsylvania Medical College.

Medical Department of the Western University of Pennsylvania.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

The Baltimore Medical College.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid acid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Particularly applicable to conditions of **mal-nutrition.**

A reliable **tonic** in **convalescence** from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in **glandular enlargements, scrofulosis, imperfect bone formation** or **impairment of the central nervous system.** An easily appropriated and stable combination of the soluble **Wheat Phosphates with Muriate of Quinine, Iron and Strychnia.**

Of greater strength than the Various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

VACCINE MATTER.

For the accommodation of our Subscribers, we will supply both Bovine and Humanized Vaccine Virus.

Guaranteed to be fresh and in every respect first class.

PRICES:

Bovine Crusts, - - -	$1 50 each
Bovine Points or Quills, -	1.00 a dozen.
Humanized Crusts, - -	1.00, small.
Humanized Crusts, - -	2.00, large.

The Humanized Crusts are warranted to be from typical cases, and in every instance from healthy children, with unquestionable family histories.

PLEASE ACCOMPANY THE ORDER WITH THE MONEY.

Address, **The Butler Publishing Company,**
P. O. Box 843 PHILADELPHIA.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DÉVIATION DES RÈGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system. and thus relieves all abnormal conditions.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

CH. MARCHAND'S

PEROXIDE OF HYDROGEN:

(MEDICINAL) H_2O_2 (ABSOLUTELY HARMLESS.)

THE MOST POWERFUL BACTERICIDE AND PUS DESTROYER ENDORSED BY THE MEDICAL PROFESSION.
UNIFORM IN STRENGTH, PURITY, STABILITY.
RETAINS GERMICIDAL POWER FOR ANY LENGTH OF TIME.
TAKEN INTERNALLY OR APPLIED EXTERNALLY WITH PERFECT SAFETY.

Send for free book of 72 pages giving articles by the following contributors:

NERVOUS EXHAUSTION.

Horsford's Acid Phosphate.

Recommended as a restorative in all cases where the nervous system has been reduced below the normal standard, by overwork, as found in brain-workers, professional men, teachers, students, etc., in debility from seminal losses, dyspepsia of nervous origin, insomnia where the nervous system suffers.

It is readily assimilated and promotes digestion.

Dr. B. H. BOYD, Lafayette, Ind., says: "I have used it in several cases of nervous exhaustion, with uniformly good results.

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Prepared under direction of Prof. E. N. HORSFORD, by the

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

212 S. Fifteenth St., Philadelphia.

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May. 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.

EDWARD T. REICHERT, M. D., Professor of Physiology.

WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.

BARTON COOKE HIRST, M. D., Professor of Obstetrics.

J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.

JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.

GEORGE A. PIERSOL, M. D., Professor of Anatomy.

JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.

LOUIS A. DUHRING, M. D., Professor of diseases of the skin.

JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1**;" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S*," viz., "*Ext. Carnis Fl. Comp.* (*Colden*)." A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

C. N. CRITTENTON, General Agent, 115 Fulton St., New York.

GLENN'S SULPHUR SOAP.

BEWARE OF COUNTERFEITS.

Physicians know the great value of the local use of Sulphur in the **Treatment of Diseases of the Skin.**

Constantine's Pine-Tar Soap.

THE BEST SOAP MADE.

Has been on trial among physicians for very many years as a healing agent. **By far the Best Tar Soap made.**

Wholesale Depot, C. N. CRITTENTON, 115 Fulton St, New York.

Samples of above Soaps SENT FREE, on application, to any Physician enclosing card

"CURIOUS QUESTIONS."

An Encyclopaedia of the Rare and Curious.

Third Improved Edition Now Ready.

"Curious Questions" fills a niche wholly its own. Its mission is to tell you hundreds of things that you ought to know, and don't; to enlarge your conversational powers; to brighten your intellect, and lead you to further research in the best channels of thought, and to keep you from exposing your ignorance on many questions of daily recurrence.

Do not think you are too wise to profit by it, when Rev. Dr. Andrew Preston Peabody, of Harvard University, says of "Curious Questions:"

> **"I find that some of the questions are such as I could not have answered, or have known where to look for their answers. Such a book will be of inestimable service and value to any intelligent person, young or old."**

The new de luxe editions (25 full-page illustrations) are unexcelled for presentations. Prices, $4.00, $6.00 and $8.00 a set.

Sold by subscription through our regularly authorized solicitors, or supplied direct by the publishers. Illustrated descriptive catalogue and sample pages free. *Agents wanted.* Address the sole publishers,

Keystone Publishing Company,

Eighth and Locust Streets, Philadelphia, Pa.

FRELIGH'S TABLETS,

(Cough and Constituent).

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{60}$ gr.), Atropiæ Sulph. ($\frac{1}{600}$ gr.), Codeia ($\frac{1}{60}$ gr.), Antimony Tart. $\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis, fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{60}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of th profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that th applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

I. O. WOODRUFF & CO.,

MANUFACTURERS OF PHYSICIANS' SPECIALTIES,

38 Maiden Lane, **New York City.**

Saliva changes Starch Foods to Dextrine & Sugar.

Gastric Juice ---"--- { Proteids (Meat, Egg &c) to Peptone in acid medium.
Milk Casein curdled.

Pancreatic Juice ---"- { Proteids (Meat, Egg, Milk &c) to Peptone in alkaline or neutral medium.
Milk Casein Curdled.
Starch Foods to Dextrine & Sugar.
Fats Emulsified.

Papoid gives the combined action of Saliva, Gastric & Pancreatic Juice.

Digests all kinds of Food. Acts under all conditions.
Acts all the time the food is in the body.
Is a tonic to the digestive organs.

Johnson & Johnson.
Chemists. N.Y.

A REFRESHING TONIC AND RECONSTRUCTIVE.

While the most prominent use for the Hypophosphites of Lime and Soda is in the treatment of Consumption and Scrofula, in which its tonic and tissue-building properties render it particularly efficacious, yet it has other and quite varied uses, based upon these same properties. One of the most marked of these is its use as a tonic reconstructive in hot weather.

Many persons have fair health during the cooler months of the year, yet suffer greatly from debility during the long, hot summer. The relaxing effects of the heat itself, besides the loss of the salts of the tissues, through the excessive colliquative perspiration, prove exceedingly depressing to the vital powers. Not only is this condition of extreme debility very depressing in itself, but it also predisposes the victims to attacks of disease which they would otherwise be able to resist. Thus during the heated term, we have a long list of protracted, exhaustive fevers, for the fatal issue of which the extreme debility of the patients is largely responsible.

In all this we may see another demonstration of the value of the phosphorus salts of lime and soda as tonic and vitalizing agents in the animal economy, and also a definite clue to the proper remedy for the condition described, as these tissue-salts are largely wasted in excessive perspiration. This remedy is the pure Hypophosphites of Lime and Soda. By its tonic properties, refreshing, revitalizing and invigorating the entire system, it restrains the excessive perspiration, and the consequent waste is checked. But it also furnishes the system with healthy tissue-food to replace with new and vigorous cells the necessary waste incident to the ordinary physiological processes. Thus the system is kept all the time up to a prime condition of physical stren[illegible]nd mental exhilaration, and germ [illegible]isease find little encouragement [illegible]vasion.

It would be advisable that those who "do not bear hot weather well" should resort each year to a course of the Hypophosphites of Lime and Soda, and thus fortify the system against *certain* exhaustion and *possible* malignant disease.

Direct them to put a teaspoonful of McArthur's Syrup occasionally in a glass of cold water, as a drink, and the "insatiable thirst" will be more easily relieved. Recommend this also, to your consumptive and scrofulous patients, and those afflicted with diseases characterized by exhausting discharges and great debility, and they will report the summer as the most refreshing season they have ever passed. The McArthur Hypophosphite Co., Boston, Mass., will send upon request to any physician not familiar with McArthur's Syrup, a full sized bottle, by express, without expense, save the express charge; also, interesting matter about the value and uses of the Hypophosphites.

Caution :—McArthur's Syrup is never sold in bulk. If the Syrup effervesces or forms a precipitate, you may be sure it is not McArthur's.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Geromorph.sm.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentat on of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

LONDON. PARIS. CALCUTTA. MONTREAL.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

ERGOTOLE S & D's

is a Concentrated (2½ grs. of select Spanish Ergot to each minim)
Purified (all inert and irritating matter is removed)
Permanent (it *keeps* perfectly without deterioration)
Preparation of Ergot that

Does not Produce Nausea

when given by the mouth, and does not produce irritation or abscess when exhibited *hypodermically*.

We will send samples and literature.

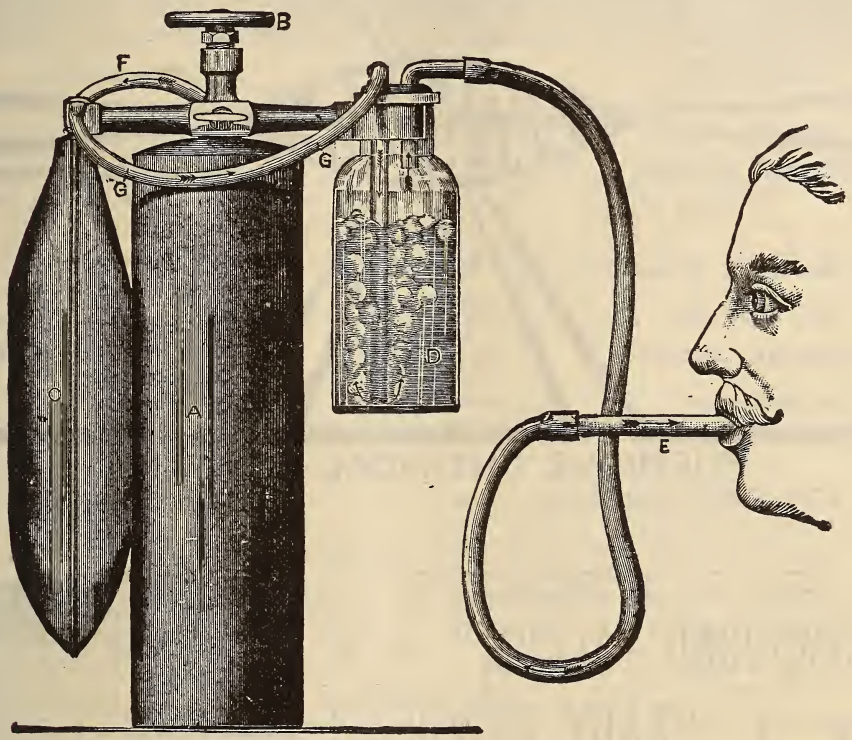
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.,

PHILADELPHIA, NEW YORK, BOSTON, CHICAGO, BROOKLYN, ATLANTA.

PREFERABLE TO CORROSIVE SUBLIMATE

Because it is not poisonous

Because it possesses superior antiseptic properties

Because it forms no insoluble compounds with the animal fluids

Because it produces no pain or irritation even of abraded surfaces

For use in all cases and under all circumstances where

CORROSIVE SUBLIMATE

has hitherto been employed

APPLICABLE WHEREVER AN ANTISEPTIC IRRIGATION or Lotion is indicated and as a Prophylactic and Disinfectant under any and all circumstances

CHLORO PHENIQUE

PERFECTLY MISCIBLE WITH WATER

For washing out the cavities, or THE BLADDER IN CHRONIC CYSTITIS it has no equal

A Non-Irritant Non-Poisonous Antiseptic and Parasiticide of Great Energy

In FOUL WOUNDS, ABSCESSES, SUPPURATING SINUSES, BUBOES, etc., CHLORO-PHÉNIQUE is used to cleanse and to prepare the way for "Campho-Phenique," which latter as a permanent dressing, subdues pain, prevents the formation of pus, and hastens healing in a remarkable manner

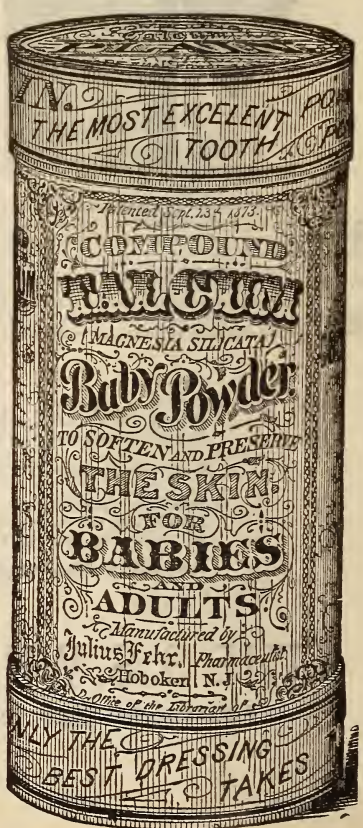
Only advertised in Medical and Pharmaceutical prints.



Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will **not decompose**, and the danger (so common to other like preparations) of administering a preparation of **free iodine**, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

Western Pennsylvania Medical College.

Medical Department of the Western University of Pennsylvania.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

IN MEDICAL PRACTICE

there are many "hard questions" arising daily. The busy practitioner is settled in his own mind. Frequently, however, he has not analyzed the reasons leading to his conclusions. "MERCK'S BULLETIN" does the thinking, the analyzing, the proving. It gives him a reason for the faith that is within him. It covers the entire field. The editors and contributors are pre-eminent in their special lines. It is the leading exponent of progressive medicine in all branches. It spends more money for contributions in a month than other journals do in a year. It claims the support of intelligent physicians, because it deserves it. The magazine speaks for itself to all who examine it.

Prompt and Complete Solubility Essential to the Perfect Pill.

WE HAVE BRIEFLY REFERRED to purity, precision and uniformity as requisites to properly made remedies.

PROMPT SOLUBILITY also, is a strictly essential attribute of the perfect pill, since without it no useful therapeutic effect can be obtained, while gastric disturbances, or toxic results from accumulation, would be very liable to arise.

TO OBTAIN A READY AND COMPLETE disintegration of the pill in the stomach juces, there should be not only a perfect

SOLUBILITY of the mass and its coating, but
SOUNDNESS as to the substances employed;
SUITABILITY as to excipients, and the application of
SPECIAL SKILL in meeting the necessary chemical and pharmaceutical conditions.

THE MEDICAMENTS MUST BE SOUND, lest, with age, chemical changes be produced which would result in the formation of insoluble compounds. The Excipients Must be Suited to the nature of the drugs employed so as to lessen the chances of change. Skill Must be Used to prevent these reactions from taking place during the manipulative processes or afterward.

IN THE PREPARATION OF THE W. H. S. & Co. PILL, attention has been given to all of these points and to many others to which we have not here referred.

PRACTITIONERS will find below the names of some of our preparations. Among them are several which are widely prescribed at this time of year.

Pil. Cupri Arsenitis, "W. H. S. & Co."

ADMINISTERED IN *Diarrhœa, Dysentery, Diarrhœa* of *Phthisis, Cholera Morbus, Cholera Infantum* and *Typhoid Fever.* (Pills of 1-5000; 1-3000 and 1-100 grain.)

Pil. Hydrargyri Tannici, "W. H. S. & Co."

ADMINISTERED IN All the *Forms* and *Stages* of *Syphilis,* and in all cases in which *Mercury* is indicated. *It does not irritate or salivate.* (Pills of ½ and 1 gr.)

Pil. Quiniæ, Ferri et Zinci Valerianat., "W. H. S. & Co."

ADMINISTERED IN *Nervous Tension* and *"Worry"* in women; in *Melancholia, Epilepsy, Hysteria, Neurasthenia, Delirium Tremens, Dysmenorrhœa,* and all *Neuroses* dependent upon the *Cares* and *Anxieties* of modern life. (Pills of 3 grs. containing 1 gr. each of the three salts.)

Pil. Salol, "W. H. S. & Co."

ADMINISTERED IN *Dysentery, Diarrhœa, Typhoid Fever, Acute Angina, Tonsilitis, Rheumatism,* and *Rheumatoid Affections* in general. In *bowel troubles* it acts as a *safe* and *effective antiseptic.* (Pills of 2½ and 5 grains; Dose 2½ to 15 grains.)

W. H. Schieffelin & Co., New York.

"COMING OUR WAY."

THE WM. S. MERRELL CHEMICAL CO., are the original, the largest and practically the ONLY manufacturers of True Salicylic Acid from Natural Wintergreen Oil; and the lack of faith—amounting to practical unbelief—in the necessity for careful specification, has enabled unprincipled or incompetent makers to market their product and supply that class of buyers who believe in something "cheap," especially if assured by interested distributors that "it is just as good."

READ THIS!

A Salicylic Uncertainty.

A warning key-note struck by an unprejudiced and disinterested writer in favor of high qualities and positive therapeutics.

The fact that a synthetic chemical gives reactions apparently identical with its native prototype does not establish indentity of physiological action. Even the natural alkaloid caffeine has been shown by clinical experiment to differ in its action when derived from different plants.

Charteris and others have shown that salicylic acid obtained from oil of wintergreen differs in its therapeutic effects from that made by synthesis, and physicians sometimes insist on having the former kind, which is much more expensive.

But artificial oil of wintergreen has become quite common. It is made by combining artificial salicylic acid with the methyl radical of methyl alcohol. Now, it is said that certain manufacturers have adopted the idea of using this artificial oil for the production of salicylic acid; that is, they juggle with what remnants of conscience they may have, by taking artificial salicylic acid out of a compound into which they or somebody else has put it, and calling this "acid from the oil."

This circumstance will lead to confusion as to the real source of a given salicylic acid and we regret to have to admit that there are probably some dealers who will resort to the subterfuge of supplying "acid from the oil," when they know that the oil was not the natural product. So where such acid is desired, the pharmacist must demand of his dealer a guarantee extending to the oil itself.

Editorial Druggist's Circular,
May, 1892.

The best dispensers always specify "MERRELL'S."

True Salicylic Acid } From Natural
True Salicylate Sodium } Wintergreen Oil.

The **"Merrell Co."** do not sell, use or handle Synthetic Oil Wintergreen or acid made from it.

The **"Merrell Co."** do not "rub up" Commercial Salicylic Acid with a little Oil Wintergreen and call it Salicylic Acid from Wintergreen Oil, and recommend the "light feathery crystals" thus produced as the "proper thing."

The **"Merrell Co."** do not claim that True Salicylic Acid has "a slight odor of the oil"—for when pure and properly prepared, it has an odor peculiarly its own, but it is not a Wintergreen odor.

Crystals of True Salicylic Acid are large, firm and hard—from ¼ to ¾ inch long, of measurable thickness, and much heavier in a given bulk than acid prepared "in a mortar" from Synthetic Oil and Commercial Acid.

THE WM. S. MERRELL CHEMICAL CO.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two **FLUID** drachms, in **WATER**, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful **IN WATER**, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong anti eptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

"As a disinfectant for all the sanitary needs of the sick-room, Platt's Chlorides is especially recommended."

Endorsed by thousands of Physicians, and having commanded a large sale for many years, Platt's Chlorides can readily be procured from almost any druggist in any city, town or village in the United States. It is an odorless liquid, and is sold in quart bottles only.

CH. MARCHAND'S

PEROXIDE OF HYDROGEN.

(MEDICINAL) H_2O_2 (ABSOLUTELY HARMLESS.)

THE MOST POWERFUL BACTERICIDE AND PUS DESTROYER.
ENDORSED BY THE MEDICAL PROFESSION.
UNIFORM IN STRENGTH, PURITY, STABILITY.
RETAINS GERMICIDAL POWER FOR ANY LENGTH OF TIME.
TAKEN INTERNALLY OR APPLIED EXTERNALLY WITH PERFECT SAFETY.

Send for free book of 72 pages giving articles by the following contributors:

DR. JOHN AULDE, of Philadelphia, Pa. "Hydrogen Peroxide—Résumé." *New York Medical Journal.*

DR. E. CHAREST, of St. Cloud, Minn. "Peroxide of Hydrogen for Gonorrhœa." *Medical World* of Philadelphia, Pa.

NOTE.—Avoid substitutes—in shape of the commercial article bottled—unfit and unsafe to use as a medicine.

Ch. Marchand's Peroxide of Hydrogen (Medicinal) sold only in 4-oz., 8-oz., and 16-oz. bottles, bearing a blue label, white letters, red and gold border, with his signature. Never sold in bulk.

PHYSICIANS WILLING TO PAY EXPRESS CHARGES WILL RECEIVE FREE SAMPLE ON APPLICATION.

SEDATIVE. ANODYNE.

EFFERVESCENT

BROMO
(WARNER & CO.)
SODA.

Caffein 1 Grain, Bromide Soda 30 Grains in each heaping teaspoonful.

USEFUL IN

Nervous Headache, Sleeplessness, Excessive Study, Migraine, Nervous Debility, Mania, as a Remedy in Sea-sickness, and Epilepsy.

Dose and Composition.—A heaping teaspoonful, containing Bromide Soda 30 grains, and Caffein 1 grain, in half a glass of water, to be repeated once after an interval of 30 minutes, if necessary.

ANTI-RHEUMATIC. SEDATIVE.

EFFERVESCENT.

BROMO
(WARNER & CO.)
LITHIA.

EACH DESSERTSPOONFUL CONTAINS:

℞ **Salicylate Lith a 10 grains, and Bromide Soda 10 grains.**

A REMEDY IN THE TREATMENT OF

RHEUMATISM, GOUTY DIATHESIS, ETC.

Dr. A. Garrod, the well-known English authority on Gout, who was the first physician to introduce the Lithia Salts in the treatment of Gouty Diathesis, states that their action is materially increased by being administered in a *freely diluted form.*

This effervescing salt of Lithia furnishes an easy and elegant way of applying Dr. Garrod's methods.

INGLUVIN

A SPECIFIC FOR VOMITING IN PREGNANCY.

A POWDER:—PRESCRIBED IN THE SAME MANNER, DOSES & COMBINATION AS PEPSIN

In Doses of from 10 to 20 Grains,

AND A POTENT AND RELIABLE REMEDY FOR THE CURE OF

Marasmus, Cholera Infantum, Indigestion, Dyspepsia and Sick Stomach,

caused from debility of that organ. It is superior to the Pepsin preparations, since it acts with more certainty, and effects cures where they fail.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

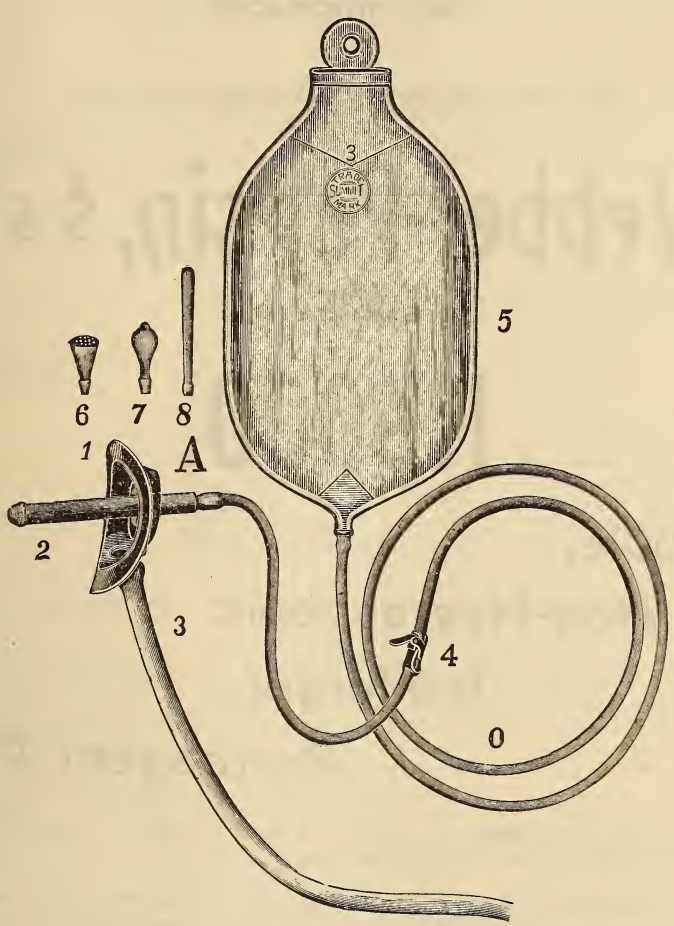
THE DOLIBER-GOODALE CO., BOSTON, MASS.

MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.

AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.



Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.

No. 2—The Irrigating Tube.

No. 3—Large Waste Pipe.

No. 4—Stop Cock.

No. 5—Large Rubber Fountain Bag.

No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.

No. 6—Eye Spray.

No. 7—Nose and Ear Douche combined.

No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

THE B. F. GOODRICH CO.

PRICE, $5.00.

SOLE MANUFACTURERS,

AKRON, OHIO.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

Baltimore, Md., U. S. A.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. PALATABLE. EFFICIENT

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Western Pennsylvania Medical College.

Medical Department of the Western University of Pennsylvania.

The Regular Session begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The Spring Session embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that Inebriety is a disease, and curable, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

LUXURY OF MODERN RAILWAY TRAVEL.

A recent trip over the Royal Blue Line, New York to Washington and return, impressed the writer most strongly as to the wonderful possibilities regarding speed and luxury in railway travel in America. Having been in nearly every state in the Union and over a large part of Europe we are prepared to feel ourselves acquainted with railway transportation thoroughly, and while in no way failing to recognize the splendid service furnished the public by the great railway lines of America, the writer believes that he is stating nothing too strongly in saying that in his judgment there is not a service in the world, which taken as a whole, will compare with the famous Royal Blue Line, composed of the Central Railroad of New Jersey, the Philadelphia and Reading and Baltimore and Ohio Railroads. Not only is the time made between these points via this line, the quickest ever made between New York and Washington, but with a road bed that is simply perfect, and an equipment so luxurious as to leave nothing to be desired, it furnishes no doubt the finest service of any line in the world.

Every train via the Royal Blue Line is vestibuled from end to end, and consists not only of the most luxurious parlor and sleeping cars ever made by the Pullman Palace Car Company, but also of palatial day coaches far superior to the parlor cars run on many lines, with smoking compartments fitted up with chairs and sofas, the same as in drawing room cars. Although the service is so superior and the time so quick, on no train are there any extra charges. To those who desire accommodations in the drawing room or sleeping cars only the regular additional charges are asked, and on all of the trains vestibuled day coaches are run open to the public without any extra charges whatever. The dining car service attached to the principal trains is in keeping with the splendid character of the line's service and the *cuisine* equal to the best hotels of the country. It is no wonder that the Royal Blue Line has attained phenomenal popularity, and it has not attained its position by any other reason than that it deserved it. It is so incomparably superior to any service ever inaugurated between New York and Washington that it would be surprising if the public did not patronize it so liberally; certainly no one who wants the best should take any other, and when it is considered that for the finest service in the world no additional charges of any description are required, it should receive, as it does, the endorsement and patronage of the public.—*Christian Leader.*

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{30}$ gr.), Atropiæ Sulph. ($\frac{1}{250}$ gr.), Codeia ($\frac{1}{10}$ gr.), Antimony Tart. ($\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis, fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{50}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of th profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that th applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

I. O. WOODRUFF & CO.,

A REFRESHING TONIC AND RECONSTRUCTIVE.

While the most prominent use for the Hypophosphites of Lime and Soda is in the treatment of Consumption and Scrofula, in which its tonic and tissue-building properties render it particularly efficacious, yet it has other and quite varied uses, based upon these same properties. One of the most marked of these is its use as a tonic reconstructive in hot weather.

Many persons have fair health during the cooler months of the year, yet suffer greatly from debility during the long, hot summer. The relaxing effects of the heat itself, besides the loss of the salts of the tissues, through the excessive colliquative perspiration, prove exceedingly depressing to the vital powers. Not only is this condition of extreme debility very depressing in itself, but it also predisposes the victims to attacks of disease which they would otherwise be able to resist. Thus during the heated term, we have a long list of protracted, exhaustive fevers, for the fatal issue of which the extreme debility of the patients is largely responsible.

In all this we may see another demonstration of the value of the phosphorus salts of lime and soda as tonic and vitalizing agents in the animal economy, and also a definite clue to the proper remedy for the condition described, as these tissue-salts are largely wasted in excessive perspiration. This remedy is the pure Hypophosphites of Lime and Soda. By its tonic properties, refreshing, revitalizing and invigorating the entire system, it restrains the excessive perspiration, and the consequent waste is checked. But it also furnishes the system with healthy tissue-food to replace with new and vigorous cells the necessary waste incident to the ordinary physiological processes. Thus the system is kept all the time up to a prime condition of physical strength and mental exhilaration, and germs of disease find little encouragement for invasion.

It would be advisable that those who "do not bear hot weather well" should resort each year to a course of the Hypophosphites of Lime and Soda, and thus fortify the system against *certain* exhaustion and *possible* malignant disease.

Direct them to put a teaspoonful of McArthur's Syrup occasionally in a glass of cold water, as a drink, and the "insatiable thirst" will be more easily relieved. Recommend this also, to your consumptive and scrofulous patients, and those afflicted with diseases characterized by exhausting discharges and great debility, and they will report the summer as the most refreshing season they have ever passed. The McArthur Hypophosphite Co., Boston, Mass., will send upon request to any physician not familiar with McArthur's Syrup, a full sized bottle, by express, without expense, save the express charge; also, interesting matter about the value and uses of the Hypophosphites.

Caution :—McArthur's Syrup is never sold in bulk. If the Syrup effervesces or forms a precipitate, you may be sure it is not McArthur's.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of diseases of the skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment.

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G. T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chrysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

A VALUABLE AGENT.

APOLLINARIS "The Queen of Table Waters"

"I can recommend it in the strongest terms. Of great value in cases of acid stomach."

LEWIS A. SAYRE, M. D.

Professor of Orthopedic Surgery in Bellevue Hospital Medical College: Surgeon to Bellevue Hospital, etc.

"Light, sparkling, and easy of digestion."

FORDYCE BARKER, M. D.

Professor of Clinical Midwifery and Diseases of Women in Bellevue Hospital Medical College: Surgeon of the New York State Woman's Hospital, etc.

"Healthful as well as agreeable. Well suited for Dyspeptics."

AUSTIN FLINT, M. D.

Professor of the Principles and Practice of Medicine and Clinical Medicine in Bellevue Hospital Medical College: Visiting Physician to Bellevue Hospital, etc.

"Every case of Typhoid Fever is a case of water poisoning. This is a useful item for the public to keep in mind."

NEW YORK MEDICAL RECORD.

January 9th, 1892.

"The PURITY of APOLLINARIS offers the best SECURITY against the DANGERS which are common to most of the drinking waters."

LONDON MEDICAL RECORD.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

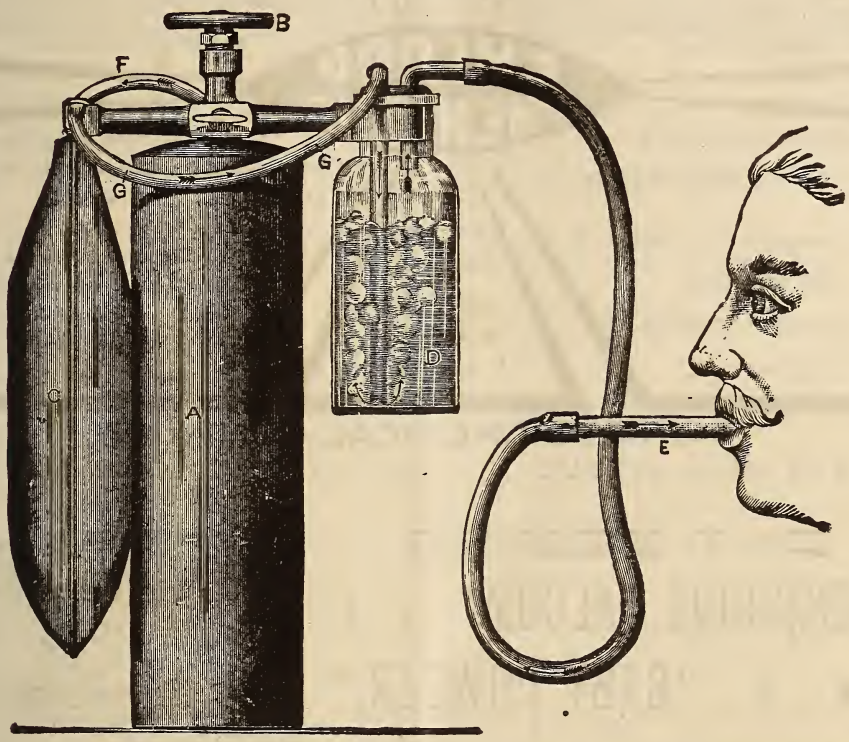
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.,

PHILADELPHIA, NEW YORK, BOSTON, CHICAGO, BROOKLYN, ATLANTA.

PREFERABLE TO CORROSIVE SUBLIMATE

Because it is not poisonous
Because it possesses superior antiseptic properties
Because it forms no insoluble compounds with the animal fluids
Because it produces no pain or irritation even of abraded surfaces

For use in all cases and under all circumstances where CORROSIVE SUBLIMATE has hitherto been employed

APPLICABLE WHEREVER AN ANTISEPTIC IRRIGATION or Lotion is indicated and as a Prophylactic and Disinfectant under any and all circumstances

CHLORO PHENIQUE

PERFECTLY MISCIBLE WITH WATER

For washing out the cavities, or THE BLADDER IN CHRONIC CYSTITIS it has no equal

A Non-Irritant Non-Poisonous Antiseptic and Parasiticide of Great Energy

In FOUL WOUNDS, ABSCESSES, SUPPURATING SINUSES, BUBOES, etc., CHLORO-PHÉNIQUE is used to cleanse and to prepare the way for "Campho-Phenique," which latter as a permanent dressing, subdues pain, prevents the formation of pus, and hastens healing in a remarkable manner

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. PALATABLE. EFFICIENT

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

The Baltimore Medical College.

PRELIMINARY FALL COURSE begins Sept. 1, 1892.
REGULAR WINTER COURSE begins October 1, 1892.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

T. D. CROTHERS, M. D.,
Sup't Walnut Lodge, Hartford, Conn.

DR. MASSEY'S

PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

G. BETTON MASSEY, M. D.,
212 S. Fifteenth St., Philadelphia.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

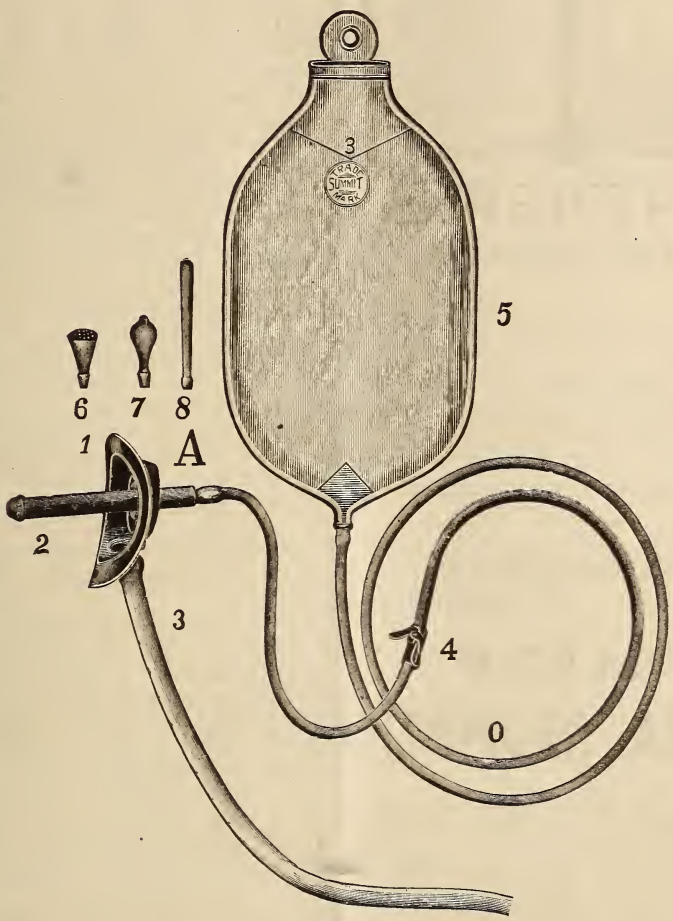
MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.



AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.

Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.
No. 2—The Irrigating Tube.
No. 3—Large Waste Pipe.
No. 4—Stop Cock.
No. 5—Large Rubber Fountain Bag.
No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.
No. 6—Eye Spray.
No. 7—Nose and Ear Douche combined.
No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

LUXURY OF MODERN RAILWAY TRAVEL.

A recent trip over the Royal Blue Line, New York to Washington and return, impressed the writer most strongly as to the wonderful possibilities regarding speed and luxury in railway travel in America. Having been in nearly every state in the Union and over a large part of Europe we are prepared to feel ourselves acquainted with railway transportation thoroughly, and while in no way failing to recognize the splendid service furnished the public by the great railway lines of America, the writer believes that he is stating nothing too strongly in saying that in his judgment there is not a service in the world, which taken as a whole, will compare with the famous Royal Blue Line, composed of the Central Railroad of New Jersey, the Philadelphia and Reading and Baltimore and Ohio Railroads. Not only is the time made between these points via this line, the quickest ever made between New York and Washington, but with a road bed that is simply perfect, and an equipment so luxurious as to leave nothing to be desired, it furnishes no doubt the finest service of any line in the world.

Every train via the Royal Blue Line is vestibuled from end to end, and consists not only of the most luxurious parlor and sleeping cars ever made by the Pullman Palace Car Company, but also of palatial day coaches far superior to the parlor cars run on many lines, with smoking compartments fitted up with chairs and sofas, the same as in drawing room cars. Although the service is so superior and the time so quick, on no train are there any extra charges. To those who desire accommodations in the drawing room or sleeping cars only the regular additional charges are asked, and on all of the trains vestibuled day coaches are run open to the public without any extra charges whatever. The dining car service attached to the principal trains is in keeping with the splendid character of the line's service and the *cuisine* equal to the best hotels of the country. It is no wonder that the Royal Blue Line has attained phenomenal popularity, and it has not attained its position by any other reason than that it deserved it. It is so incomparably superior to any service ever inaugurated between New York and Washington that it would be surprising if the public did not patronize it so liberally; certainly no one who wants the best should take any other, and when it is considered that for the finest service in the world no additional charges of any description are required, it should receive, as it does, the endorsement and patronage of the public.—*Christian Leader.*

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid acid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Particularly applicable to conditions of **mal-nutrition.**

A reliable **tonic** in **convalescence** from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in **glandular enlargements, scrofulosis, imperfect bone formation** or **impairment of the central nervous system.** An easily appropriated and stable combination of the soluble **Wheat Phosphates** with **Muriate** of **Quinine, Iron** and **Strychnia.**

Of greater strength than the Various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince Street, New York.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

CH. MARCHAND'S

PEROXIDE OF HYDROGEN.

(MEDICINAL) H_2O_2 (ABSOLUTELY HARMLESS.)

THE MOST POWERFUL BACTERICIDE AND PUS DESTROYER.
ENDORSED BY THE MEDICAL PROFESSION.
UNIFORM IN STRENGTH, PURITY, STABILITY.
RETAINS GERMICIDAL POWER FOR ANY LENGTH OF TIME.
TAKEN INTERNALLY OR APPLIED EXTERNALLY WITH PERFECT SAFETY.

Send for free book of 72 pages giving articles by the following contributors:

DR. E. R. SQUIBB, of Brooklyn, N. Y. "On the Medicinal Uses of Hydrogen Peroxide." *Gaillard's Medical Journal*, N. Y.

DR. J. H. DeWOLF, of Baltimore, Md. "Medicinal Peroxide of Hydrogen and Glycozone." *Southern Medical and Surgical World* of Baltimore, Md.

NOTE.—Avoid substitutes—in shape of the commercial article bottled—unfit and unsafe to use as a medicine.

Ch. Marchand's Peroxide of Hydrogen (Medicinal) sold only in 4-oz., 8-oz., and 16-oz. bottles, bearing a blue label, white letters, red and gold border, with his signature. Never sold in bulk.

GASTRIC DERANGEMENTS

HORSFORD'S ACID PHOSPHATE

Unlike all other forms of phosphorus in combination, such as dilute phosphoric acid, glacial phosphoric acid, neutral phosphate of lime, hypophosphites, etc., the phosphates in this product are in solution, and readily assimilated by the system, and it not only causes no trouble with the digestive organs, but promotes in a marked degree their healthful action.

In certain forms of dyspepsia it acts as a specific.

Dr. T. G. COMSTOCK, of the Good Samaritan Hospital, St. Louis, says: "For some years we have used it in a variety of derangements characterized by debility, as also in chronic gastric ailments. It is approved of, unanimously, by the medical staff of this Hospital."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Prepared under the direction of Prof. E. N. HORSFORD, by the

Rumford Chemical Works, Providence, R. I.

DR. WM. T. HOWARD,

Professor of Diseases of Women and Children in the University of Maryland, says:

After comparing the water of **SPRING NO. 1** with that of a very celebrated water

"Indeed, in a certain class of cases, it is much superior to the latter. I allude to the abiding debility attendant upon the tardy convalescence from grave acute diseases, and more especially to the Cachèxia and Sequelæ incident to Malarious Fevers in all their grades and varieties, to certain forms of Atonic Dyspepsia and

All the Affections Peculiar to Women

that are remediable at all by mineral waters. In short, were I called upon to state from what Mineral Waters I have seen the greatest and most unmistakable amount of good accrue in the largest number of cases in a general way, I would unhesitatingly say the Buffalo Springs, in Mecklenburg County, Virginia."

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

BUFFALO LITHIA SPRINGS, VA.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

FREDERICK STEARNS & CO.

MANUFACTURING PHARMACISTS,
DETROIT, MICH.

DEER PARK AND OAKLAND.

To those contemplating a trip to the mountains in search of health or pleasure, Deer Park, on the dome of the Alleghany Mountains, 3,000 feet above the sea level, offers such varied attractions as a delightful atmosphere during both day and night, pure water, smooth, winding roads through the mountains and valleys, and the most picturesque scenery in the Alleghany range. The hotel is equipped with such adjuncts conducive to the entertainment, pleasure and comfort of its guests, as Turkish and Russian Baths, swimming pools for both ladies and gentlemen, billiard rooms, superbly furnished parlors, and rooms single or en suite, an unexcelled cuisine and superior service.

The surrounding grounds as well as the hotel are lighted with electricity, have cosy and shady nooks, meandering walks, lawn tennis courts and grassy play grounds for children within full view of the inviting verandas. Six miles distant on the same mountain summit is Oakland, the twin resort of Deer Park, and equally as well equipped for the entertainment and accommodation of its guests. Both hotels are upon the main line of the Baltimore and Ohio Railroad, have the advantages of its splendid Vestibuled Limited Express trains between the East and West, and are, therefore, readily accessible from all parts of the country. Season Excursion tickets, good for return passage until October 31st, will be placed on sale at greatly reduced rates at all principal ticket offices throughout the country. One way tickets reading from St. Louis, Louisville, Cincinnati, Columbus, Chicago, and any point on B. & O. system to Washington, Baltimore, Philadelphia, or New York, or vice versa, are good to stop off at either Deer Park or Oakland, and the time limit will be extended by agents at either resort upon application.

The season at these popular resorts commenced June 22d.

For full information as to hotel rates, rooms, etc., address George D. DeShields, Manager, Deer Park or Oakland, Garrett County, Maryland.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. SPASMODIC. INTERMENSTRUAL. NEURALGIC. MEMBRANOUS. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will **not decompose**, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

Descriptive Pamphlets and Clinical Reports mailed on request.

Medical Department of the Western University of Pennsylvania.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.

EDWARD T. REICHERT, M. D., Professor of Physiology.

WILLIAM F. NORRIS, M. D., Professor of Ophthalmology

BARTON COOKE HIRST, M. D., Professor of Obstetrics.

J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.

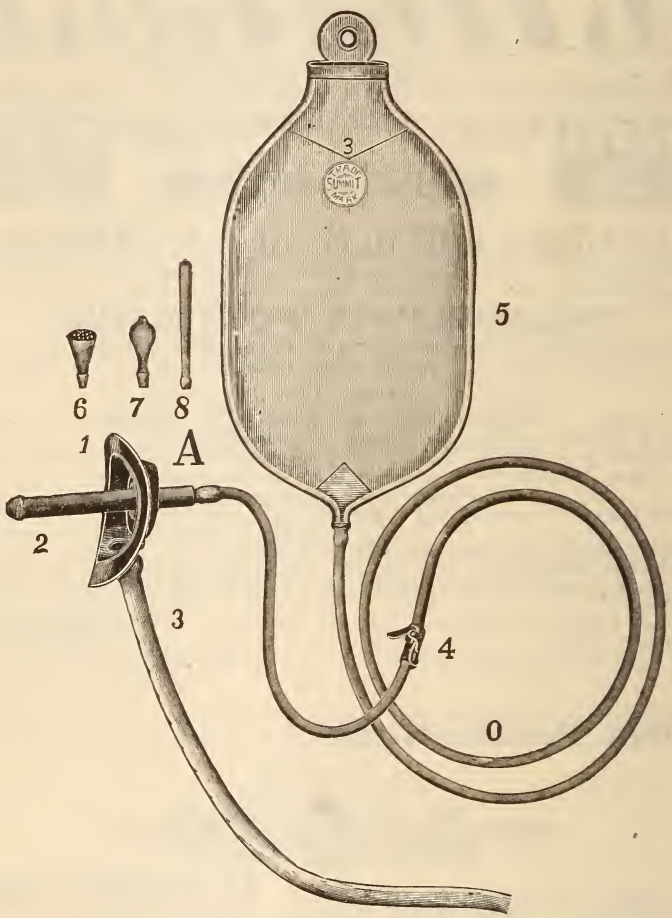
MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.



AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.

Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.
No. 2—The Irrigating Tube.
No. 3—Large Waste Pipe.
No. 4—Stop Cock.
No. 5—Large Rubber Fountain Bag.
No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.
No. 6—Eye Spray.
No. 7—Nose and Ear Douche combined.
No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

FRELIGH'S TABLETS,

(Cough and Constituent),

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{50}$ gr.), Atropiæ Sulph. ($\frac{1}{100}$ gr.), Codeia ($\frac{1}{10}$ gr.), Antimony Tart. ($\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis, fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{10}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonial from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of th profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that th applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

NEW AND OLD CURES FOR CONSUMPTION.

Many plausible theories of pathology and promising systems of cure arise from time to time to excite the hopes of those afflicted with that dread disease, consumption.

Within the past few years we have seen several such systems run their course of popular enthusiasm, professional encouragement, thorough test and ultimate failure. The best that any exclusively germicidal treatment can do, if beneficial at all, is to destroy the germs, or dislodge the germ-bearing tissues, and leave the patient in his original condition, modified by the destructive lesions which have already taken place.

Even with the best of germicidal treatments, then, in pulmonary phthisis, the reconstructive measures will still be needed to aid in the process of repair. In fact, without them the patient would be left peculiarly predisposed to immediate re-infection with the disease. It is then safe to predict that no method of treating pulmonary consumption will ever be devised, however radical in its nature, which will supersede the well-known hygienic and reconstructive measures.

The reason for this is plain to every thinking man. Even before the patient was infected at all, before any anatomical lesion existed in the tissues, at an unguarded time of lowered vitality, the germs of disease made a successful lodgment, and the destructive process commenced.

Now, it is a well established fact that the chief of all reconstructive remedies is the combined hypophosphites of lime and soda—*and this very remedy has long been in successful use in the treatment of consumption.* It is of equal value as a prophylactic in those cases that are constitutionally predisposed to the disease, and as a curative agent in the incipient and even somewhat advanced stages. It alone has proven to be more successful in curing pulmonary tuberculosis than the Koch method, and without any of its dangers and complications. It accomplishes its work gradually and insensibly, replacing new tissues cell by cell, for the broken-down, diseased tissues as they are removed in a true physiological process by the absorbent powers of the system. In this there is no sudden "reaction" or violent process, removing large and dangerous sloughs, leaving the patient prostrated by the shock, and the adjacent healthy tissues raw and exposed, liable to receive the disease germs anew, and to disseminate them throughout the system more rapidly than before.

So, then, whether any of the germicidal treatments be ultimately successful in removing the cause of the disease or not, the hypophosphites of lime and soda will still be a necessity in the armamentarium against consumption. As a specific curative agent, it will outlive them all.

But it is of the utmost importance that you assure yourself of the chemical purity of the preparation of the Hypophosphites which you use, as it is peculiarly liable to deterioration unless properly prepared. The McArthur Hypophosphite Co., Boston, Mass., will send you valuable information upon the treatment of consumption, if you so request.

CAUTION:—McArthur's Syrup is never sold in bulk. If the Syrup effervesces or forms a precipitate you may be sure it is not McArthur's.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of diseases of the skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentat on of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system. and thus relieves all abnormal conditions.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

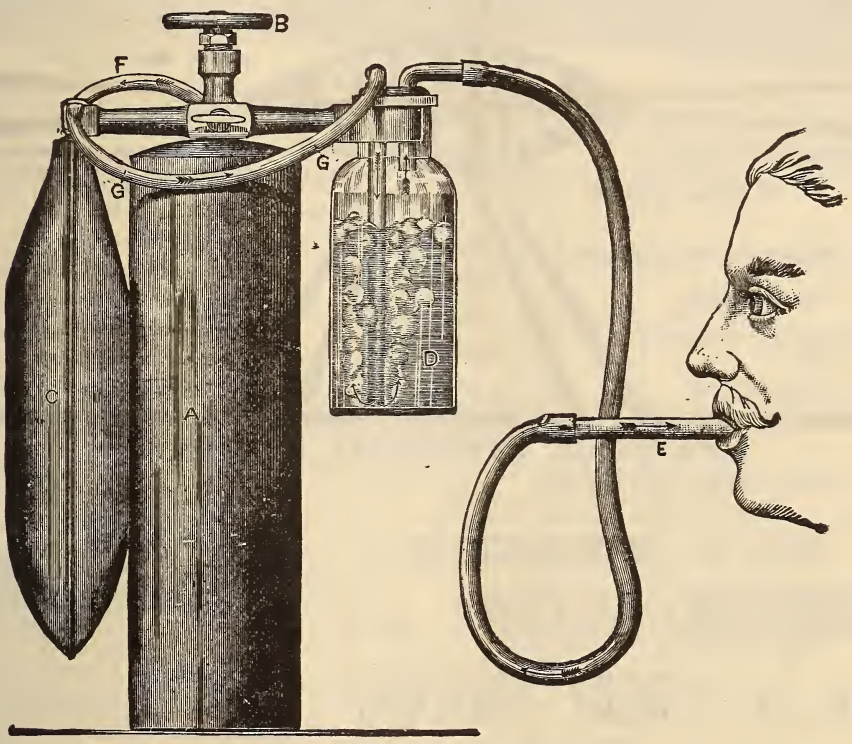
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. Imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

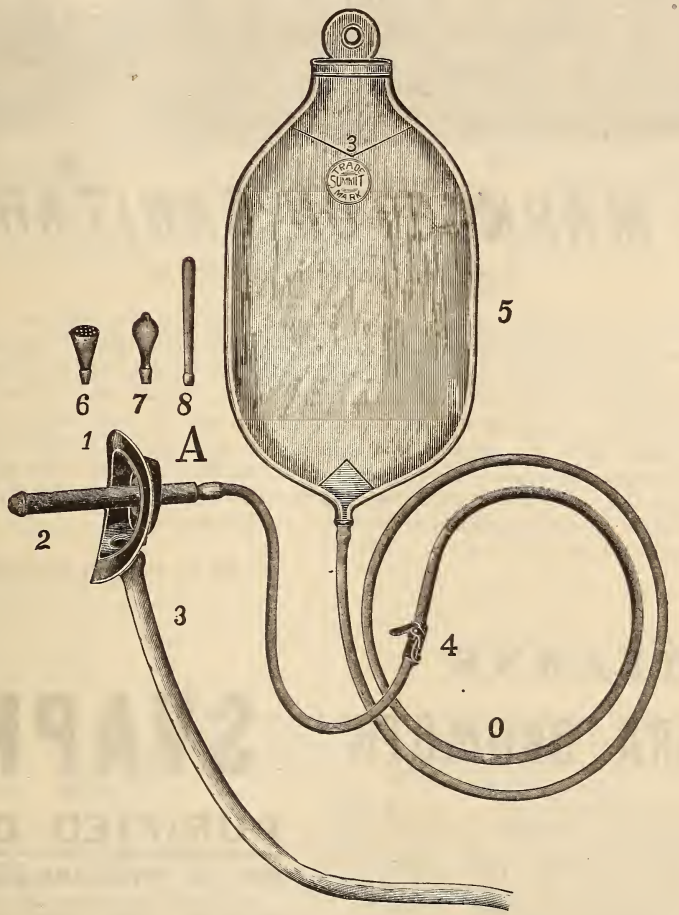
ST. LOUIS, MO

MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.

AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.



Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.
No. 2—The Irrigating Tube.
No. 3—Large Waste Pipe.
No. 4—Stop Cock.
No. 5—Large Rubber Fountain Bag.
No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.
No. 6—Eye Spray.
No. 7—Nose and Ear Douche combined.
No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

THE B. F. GOODRICH CO.

PRICE, $5.00.

SOLE MANUFACTURERS,

AKRON, OHIO.

THE MARKLETON SANITARIUM.

MARKLETON, SOMERSET COUNTY, PA.

Open all the year under the medical care of Dr. M. B. Gault and Mrs. Gault, M. D., the former with sixteen years' and the latter with seven years' experience in Sanitarium Work. Appointments first-class in every respect. While medicines are used whenever needed, the effort is made to meet all cases by the appliances of the House, as Hot and Cold Baths, Salt, Turkish, Roman, Sitz, Electro-chemical, Electro-thermal and Needle Baths, Swedish Movements, Massage, and Electricity in every form. Buildings heated by the hot water system, lighted by electricity, and supplied with pure mountain water; a quiet, restful place surrounded with beautiful mountain scenery; located on the Pittsburg Division of the B. & O. R. R., which connects with principal cities and at Johnstown and Connellsville with the P. R. R. Terms moderate. Discount for Ministers, Missionaries, Teachers, Physicians and their families.

For information, apply to—

DR. M. B. GAULT, Medical Director.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

THE SANITARIUM, BATTLE CREEK, MICHIGAN.

INCORPORATED, 1867.

The largest, most thoroughly equipped and one of the most favorably located in the United States. It is under strictly regular management. Eight physicians, well-trained and of large experience. A quiet, home-like place, where "trained nurses," "rest cure," "massage," "faradization," "galvanization," "static electrization," "Swedish movements," "dieting," "baths," "physical training," and all that pertains to modern rational medical treatment can be had in perfection at reasonable prices. **A special Hospital Building (150 Beds) for surgical cases with finest hospital facilities and appliances.**

Large Fan for Winter and Summer Ventilation. Absolutely Devoid of Usual Hospital Odors. Delightful Surroundings. Lake-side Resort. Pleasure Grounds. Steamers, Sail-boats, etc.

J. H. KELLOGG, M. D., Sup't, Battle Creek, Mich.

PURE GLUTEN BISCUIT

The undersigned have for several years been manufacturing a pure gluten for a few physicians. We are now prepared to furnish to the medical profession **the only pure gluten biscuit manufactured in America.** For samples and prices address

SANITARIUM FOOD CO., Battle Creek, Mich

IT'S TRUE

that every moment of a physician's time has value. Equally true that much medical literature does not repay the time given to its reading. "MERCK'S BULLETIN" is worth reading all the way through. It crystallizes facts. No padding. It is not a "one man" organ. It represents the best thought of two continents. No exploded theories---no ancient fallacies. It does original thinking. Its province to lead---others, to follow.

We make strong claims. Will you prove them? Examine the Journal. It costs you nothing but your time. We will send sample copy free upon request.

DEER PARK AND OAKLAND.

To those contemplating a trip to the mountains in search of health or pleasure, Deer Park, on the dome of the Alleghany Mountains 3,000 feet above the sea level, offers such varied attractions as a delightful atmosphere during both day and night, pure water, smooth, winding roads through the mountains and valleys, and the most picturesque scenery in the Alleghany range. The hotel is equipped with such adjuncts conducive to the entertainment, pleasure and comfort of its guests, as Turkish and Russian Baths, swimming pools for both ladies and gentlemen, billiard rooms, superbly furnished parlors, and rooms single or en suite, an unexcelled cuisine and superior service.

The surrounding grounds as well as the hotel are lighted with electricity, have cosy and shady nooks, meandering walks, lawn tennis courts and grassy play grounds for children within full view of the inviting verandas. Six miles distant on the same mountain summit is Oakland, the twin resort of Deer Park, and equally as well equipped for the entertainment and accommodation of its guests. Both hotels are upon the main line of the Baltimore and Ohio Railroad, have the advantages of its splendid Vestibuled Limited Express trains between the East and West, and are, therefore, readily accessible from all parts of the country. Season Excursion tickets, good for return passage until October 31st, will be placed on sale at greatly reduced rates at all principal ticket offices throughout the country. One way tickets reading from St. Louis, Louisville, Cincinnati, Columbus, Chicago, and any point on B. & O system to Washington, Baltimore Philadelphia, or New York, or vice versa, are good to stop off at either Deer Park or Oakland, and the time limit will be extended by agents at either resort upon application.

The season at these popular resorts commenced June 22d.

For full information as to hotel rates, rooms, etc., address George D. DeShields, Manager, Deer Park or Oakland, Garrett County, Maryland.

New York

Sole Agents and Sole Licensees for the United States

ARISTOL is now widely used as an agreeable and effective dressing in all of the operations of major and minor surgery and in dentistry. It is invaluable in ulcerations of all kinds, and in burns, blisters and bed-sores. It adheres closely to mucous membranes and wound surfaces. (*Aristol and "Europhen-Aristol" a combination of both remedies, are supplied in ounces.*)

EUROPHEN is a complete substitute for iodoform and is a cicatrisant, of special value in specific lesions, catarrhal and ulcerative diseases and all surgical conditions formerly treated by the latter preparation. It has five times the covering power of iodoform and forms an impervious coating over denuded tissues. Europhen has a faint, agreeable odor resembling that of saffron. (*Supplied in ounces.*)

SALOPHEN is a new salicylo-phenolic derivative said to be so combined, chemically, as to constitute a safer and more effective remedy than either of its components, or any analagous preparation. The reports refer in the highest terms to its value in acute articular rheumatism and allied affections. Competent observers recommend it for trial. (*Supplied in ounces, tablets and pills.*)

SULFONAL induces physiological sleep, free from narcosis, and without sequelæ. It acts purely as a hypnotic and claims no analgic powers. Sulfonal is also of the highest value in the neuroses and is largely employed by neurologists. It is a perfectly safe and reliable remedy and its continuous use does not give rise to a drug habit. Sulfonal must be administered according to directions. (*Supplied in ounces, tablets and pills.*)

PHENACETINE continues to justify the high commendations of physicians, and it may properly be considered as the best of the modern antipyretics and anodynes. In *la grippe*, rheumatism, migraine, neuralgia and allied maladies it is a prompt, safe and effective remedy. Phenacetine, unlike the secret mixtures announced as analgesics and antipyretics, is a true organic derivative. (*Supplied in ounces, tablets and pills.*)

"COMING OUR WAY."

THE WM. S. MERRELL CHEMICAL CO., are the original, the largest and practically the ONLY manufacturers of True Salicylic Acid from Natural Wintergreen Oil; and the lack of faith—amounting to practical unbelief—in the necessity for careful specification, has enabled unprincipled or incompetent makers to market their product and supply that class of buyers who believe in something "cheap," especially if assured by interested distributors that "it is just as good."

READ THIS!

A Salicylic Uncertainty.

A warning key-note struck by an unprejudiced and disinterested writer in favor of high qualities and positive therapeutics

The fact that a synthetic chemical gives reactions apparently identical with its native prototype does not establish indentity of physiological action. Even the natural alkaloid caffeine has been shown by clinical experiment to differ in its action when derived from different plants.

Charteris and others have shown that salicylic acid obtained from oil of wintergreen differs in its therapeutic effects from that made by synthesis, and physicians sometimes insist on having the former kind, which is much more expensive.

But artificial oil of wintergreen has become quite common. It is made by combining artificial salicylic acid with the methyl radical of methyl alcohol. Now, it is said that certain manufacturers have adopted the idea of using this artificial oil for the production of salicylic acid; that is, they juggle with what remnants of conscience they may have, by taking artificial salicylic acid out of a compound into which they or somebody else has put it, and calling this "acid from the oil."

This circumstance will lead to confusion as to the real source of a given salicylic acid and we regret to have to admit that there are probably some dealers who will resort to the subterfuge of supplying "acid from the oil," when they know that the oil was not the natural product. So where such acid is desired, the pharmacist must demand of his dealer a guarantee extending to the oil itself.

Editorial Druggist's Circular,
May, 1892.

The best dispensers always specify "MERRELL'S."

True Salicylic Acid } From Natural
True Salicylate Sodium } Wintergreen Oil.

The **"Merrell Co."** do not sell, use or handle Synthetic Oil Wintergreen or acid made from it.

The **"Merrell Co."** do not "rub up" Commercial Salicylic Acid with a little Oil Wintergreen and call it Salicylic Acid from Wintergreen Oil, and recommend the "light feathery crystals" thus produced as the "proper thing."

The **"Merrell Co."** do not claim that True Salicylic Acid has "a slight odor of the oil"—for when pure and properly prepared, it has an odor peculiarly its own, but it is not a Wintergreen odor.

Crystals of True Salicylic Acid are large, firm and hard—from ¼ to ¾ inch long, of measurable thickness, and much heavier in a given bulk than acid prepared "in a mortar" from Synthetic Oil and Commercial Acid.

FRELIGH'S TABLETS,

(Cough and Constituent),

FOR THE PREVENTION AND CURE OF

PULMONARY PHTHISIS.

FORMULÆ.

Cough Tablets.

EACH TABLET CONTAINS.

Morph. Sulph. ($\frac{1}{60}$ gr.), Atropiæ Sulph. ($\frac{1}{1000}$ gr.), Codeia ($\frac{1}{60}$ gr.), Antimony Tart. $\frac{1}{25}$ gr.), Ipecac, Aconite, Pulsatilla, Dulcamara, Causticum, Graphite, Rhus-tox, and Lachesis, fractionally so arranged as to accomplish every indication in any form of cough.

Constituent Tablets.

EACH TABLET CONTAINS.

Arsenicum ($\frac{1}{30}$ gr.), Precipitate Carb. of Iron, Phos. Lime, Carb. Lime, Silica, and the other ultimate constituents, according to physiological chemistry (normally) in the human organism, together with Caraccas. Cocoa and Sugar.

PRICE, THREE DOLLARS PER DOUBLE BOX.

Containing sufficient Tablets of each kind to last from one to three months according to the condition of the patient.

SPECIAL OFFER.

While the above formulæ have been in use, in private practice, over 30 years, and we could give testimonials from well-known clergymen, lawyers and business men, we prefer to leave them to the unbiased judgment of the profession with the following offer: On receipt of 50 cents, and card, letter-head, bill-head, or other proof that the applicant is a physician in active practice, we will send, delivered, charges prepaid, one of the regular (double) boxes (retail price, Three Dollars), containing sufficient of each kind of Tablets to test them three months (in the majority of cases) in some one case. Card, letter-head, or some proof that the applicant is a physician in active practice, MUST accompany each application. Pamphlet, with full particulars, price-list, etc., on request.

As we furnish no samples through the trade, wholesale or retail, for samples, directions, price-list, etc., address,

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds.

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentat on of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

RIO CHEMICAL CO., St. Louis, Mo., U. S. A.

LONDON. PARIS. CALCUTTA. MONTREAL.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

GLYCOZONE.

PREVENTS FERMENTATION OF FOOD IN THE STOMACH.

MOST POWERFUL REMEDY FOR HEALING PURPOSES. CURES:

DYSPEPSIA, GASTRITIS, ULCER OF THE STOMACH, HEART-BURN.

Send for free book of 80 pages giving articles by contributors to medical literature.

PHYSICIANS WILLING TO PAY EXPRESS CHARGES WILL RECEIVE FREE SAMPLE ON APPLICATION.

Glycozone is sold only in 4 ounce, 8 ounce, and 16 ounce bottles. Never sold in bulk.

PREPARED ONLY BY Charles Marchand

☞Mention this publication.

Chemist and Graduate of the "Ecole Centrale des Arts et Manufactures de Paris" (France).

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince St., New York

WM. R. WARNER & CO.

SEDATIVE. ANODYNE.

EFFERVESCENT

BROMO (WARNER & CO.) SODA.

Caffein 1 Grain, Bromide Soda 30 Grains in each heaping teaspoonful.

USEFUL IN

Nervous Headache, Sleeplessness, Excessive Study, Migraine, Nervous Debility, Mania, as a Remedy in Sea-sickness, and Epilepsy.

Dose and Composition.—A heaping teaspoonful, containing Bromide Soda 30 grains, and Caffein 1 grain, in half a glass of water, to be repeated once after an interval of 30 minutes, if necessary.

ANTI-RHEUMATIC. SEDATIVE.

EFFERVESCENT.

BROMO (WARNER & CO.) LITHIA.

EACH DESSERTSPOONFUL CONTAINS:

℞ Salicylate Lith a 10 grains, and Bromide Soda 10 grains.

A REMEDY IN THE TREATMENT OF

RHEUMATISM, GOUTY DIATHESIS, ETC.

Dr. A. Garrod, the well-known English authority on Gout, who was the first physician to introduce the Lithia Salts in the treatment of Gouty Diathesis, states that their action is materially increased by being administered in a *freely diluted form.*

This effervescing salt of Lithia furnishes an easy and elegant way of applying Dr. Garrod's methods.

INGLUVIN

A SPECIFIC FOR VOMITING IN PREGNANCY.

A POWDER:—PRESCRIBED IN THE SAME MANNER, DOSES & COMBINATION AS PEPSIN

In Doses of from 10 to 20 Grains,

AND A POTENT AND RELIABLE REMEDY FOR THE CURE OF

Marasmus, Cholera Infantum, Indigestion, Dyspepsia and Sick Stomach,

caused from debility of that organ. It is superior to the Pepsin preparations, since it acts with more certainty, and effects cures where they fail.

Mellin's Food

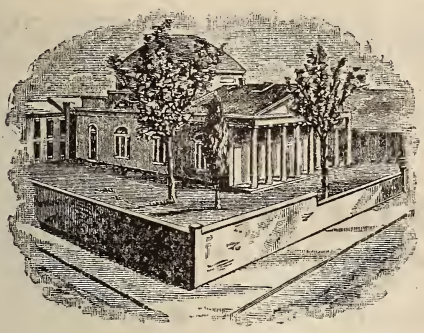
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.



UNIVERSITY OF MARYLAND—SCHOOL OF MEDICINE
BALTIMORE, MD.

DR. WM. T. HOWARD,

Professor of Diseases of Women and Children in the University of Maryland, says:

After comparing the water of **SPRING NO. 1** with that of a very celebrated water

. "Indeed, in a certain class of cases, it is much superior to the latter. I allude to the abiding debility attendant upon the tardy convalescence from grave acute diseases, and more especially to the Cachexia and Sequelæ incident to Malarious Fevers in all their grades and varieties, to certain forms of Atonic Dyspepsia and

All the Affections Peculiar to Women

that are remediable at all by mineral waters. In short, were I called upon to state from what Mineral Waters I have seen the greatest and most unmistakable amount of good accrue in the largest number of cases in a general way, I would unhesitatingly say the Buffalo Springs, in Mecklenburg County, Virginia."

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

BUFFALO LITHIA SPRINGS, VA.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

FREDERICK STEARNS & CO.

MANUFACTURING PHARMACISTS,
DETROIT, MICH.

REUNION OF OLD SAILORS AND SOLDIERS.

Two coming important events of interest to sailors and soldiers of the late war will be the Reunion of the Naval Veterans at Baltimore, September 15th to 19th, and the Encampment of the Grand Army of the Republic at Washington, commencing September 20th, immediately after the Sailors' Reunion. Interest in the reunion will be heightened by the presence of the White Squadron in the harbor of Baltimore. The G. A. R. Encampment will be the occasion of the greatest military assemblage in Washington since the Grand Review of 1865, following the fall of Richmond. For both of these events the Baltimore and Ohio Railroad will sell tickets at greatly reduced rates. Tickets will be sold from September 13th to 20th inclusive valid for return journey until October 10th. During the Encampment at Washington the Baltimore and Ohio Railroad will run Excursions daily to Gettysburg, Harper's Ferry, and the Virginia battlefield, to all of which points tickets will be sold at low rates. The Baltimore and Ohio is the familiar route to thousands of veterans who travelled over it early in the sixties as raw recruits to join the ranks.

For detailed information as to time of trains, rates, and sleeping car accommodations apply to A. J. Simmons, 211 Washington Street, Boston; C. P. Craig, 415 Broadway, New York; James Potter, 833 Chestnut St., Philadelphia, or Charles O. Scull, Gen'l Passenger Agent, Baltimore, Md.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin.

Druggists will find it to their interest to dispense this product because of its *ease of manipulation,* its great digestive power, its permanency, *its perfect solubility,* and its *reasonable price,* the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup will not decompose, and the danger (so common to other like preparations) of administering a preparation of free iodine, is absolutely avoided.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.

WILLIAM GOODELL, M. D., Professor of Gynæcology.

JAMES TYSON, M. D., Professor of Clinical Medicine.

HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics

THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.

JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.

EDWARD T. REICHERT, M. D., Professor of Physiology.

WILLIAM F. NORRIS, M. D., Professor of Ophthalmology

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness.** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal. and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1;**" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S,*" viz., "*Ext. Carnis Fl.ᵃ Comp. (Colden).*" A Sample of COLDEN'S BEEF TONIC will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

C. N. CRITTENTON, General Agent, 115 Fulton St., New York.

GLENN'S SULPHUR SOAP.

BEWARE OF COUNTERFEITS.

Physicians know the great value of the local use of Sulphur in the Treatment of Diseases of the Skin.

Constantine's Pine-Tar Soap.

THE BEST SOAP MADE.

Has been on trial among physicians for very many years as a healing agent. By far the Best Tar Soap made.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton St, New York.

Samples of above Soaps SENT FREE, on application, to any Physician enclosing card.

Average dose Pepsin is 5 grains.
" " Papoid " 1 grain.

Thus
One dose Pepsin costs $1\frac{43}{100}$ cents.
One dose Papoid costs $1\frac{25}{100}$ cents.

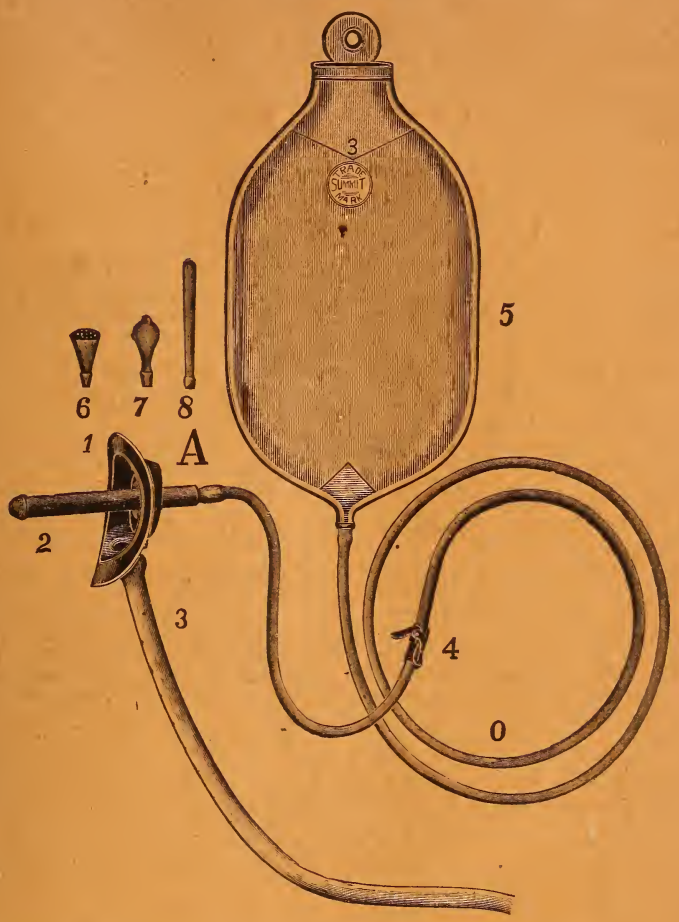
N.Y.

MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.



AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.

Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.

No. 2—The Irrigating Tube.

No. 3—Large Waste Pipe.

No. 4—Stop Cock.

No. 5—Large Rubber Fountain Bag.

No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.

No. 6—Eye Spray.

No. 7—Nose and Ear Douche combined.

No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

THE B. F. GOODRICH CO.

PRICE, $5.00.

SOLE MANUFACTURERS,

AKRON, OHIO.

NEW AND OLD CURES FOR CONSUMPTION.

Many plausible theories of pathology and promising systems of cure arise from time to time to excite the hopes of those afflicted with that dread disease, consumption.

Within the past few years we have seen several such systems run their course of popular enthusiasm, professional encouragement, thorough test and ultimate failure. The best that any exclusively germicidal treatment can do, if beneficial at all, is to destroy the germs, or dislodge the germ-bearing tissues, and leave the patient in his original condition, modified by the destructive lesions which have already taken place.

Even with the best of germicidal treatments, then, in pulmonary phthisis, the reconstructive measures will still be needed to aid in the process of repair. In fact, without them the patient would be left peculiarly predisposed to immediate re-infection with the disease. It is then safe to predict that no method of treating pulmonary consumption will ever be devised, however radical in its nature, which will supersede the well-known hygienic and reconstructive measures.

The reason for this is plain to every thinking man. Even before the patient was infected at all, before any anatomical lesion existed in the tissues, at an unguarded time of lowered vitality, the germs of disease made a successful lodgment, and the destructive process commenced.

Now, it is a well established fact that the chief of all reconstructive remedies is the combined hypophosphites of lime and soda—*and this very remedy has long been in successful use in the treatment of consumption.* It is of equal value as a prophylactic in those cases that are constitutionally predisposed to the disease, and as a curative agent in the incipient and even somewhat advanced stages. It alone has proven to be more successful in curing pulmonary tuberculosis than the Koch method, and without any of its dangers and complications. It accomplishes its work gradually and insensibly, replacing new tissues cell by cell, for the broken-down, diseased tissues as they are removed in a true physiological process by the absorbent powers of the system. In this there is no sudden "reaction" or violent process, removing large and dangerous sloughs, leaving the patient prostrated by the shock, and the adjacent healthy tissues raw and exposed, liable to receive the disease germs anew, and to disseminate them throughout the system more rapidly than before.

So, then, whether any of the germicidal treatments be ultimately successful in removing the cause of the disease or not, the hypophosphites of lime and soda will still be a necessity in the armamentarium against consumption. As a specific curative agent, it will outlive them all.

But it is of the utmost importance that you assure yourself of the chemical purity of the preparation of the Hypophosphites which you use, as it is peculiarly liable to deterioration unless properly prepared. The McArthur Hypophosphite Co., Boston, Mass., will send you valuable information upon the treatment of consumption, if you so request.

CAUTION:—McArthur's Syrup is never sold in bulk. If the Syrup effervesces or forms a precipitate you may be sure it is not McArthur's.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds.

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

UNIVERSITY OF PENNSYLVANIA---MEDICAL DEPARTMENT.

The 127th ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and of Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of diseases of the skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

A VALUABLE AGENT.

APOLLINARIS "The Queen of Table Waters"

"I can recommend it in the strongest terms. Of great value in cases of acid stomach."

LEWIS A. SAYRE, M. D.

Professor of Orthopedic Surgery in Bellevue Hospital Medical College: Surgeon to Bellevue Hospital, etc.

"Light, sparkling, and easy of digestion."

FORDYCE BARKER, M. D.

Professor of Clinical Midwifery and Diseases of Women in Bellevue Hospital Medical College: Surgeon of the New York State Woman's Hospital, etc.

"Healthful as well as agreeable. Well suited for Dyspeptics."

AUSTIN FLINT, M. D.

Professor of the Principles and Practice of Medicine and Clinical Medicine in Bellevue Hospital Medical College: Visiting Physician to Bellevue Hospital, etc.

"Every case of Typhoid Fever is a case of water poisoning. This is a useful item for the public to keep in mind."

NEW YORK MEDICAL RECORD.

January 9th, 1892.

"The PURITY of APOLLINARIS offers the best SECURITY against the DANGERS which are common to most of the drinking waters."

LONDON MEDICAL RECORD.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHESTTEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,

Non-Hygroscopic,

Inodorous,

Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation,* its great digestive power, its permanency, *its perfect solubility,* and its *reasonable price,* the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

Manufactured only by

SHARP & DOHME,

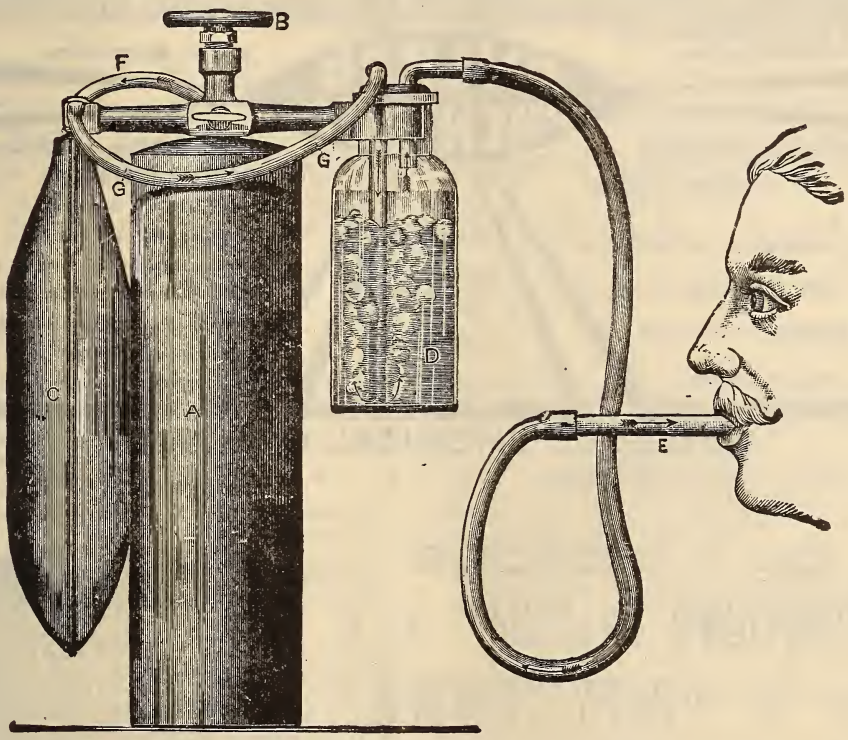
INHALATION APPARATUS

FOR

THE THERAPEUTIC ADMINISTRATION OF OXYGEN.



In the treatment of lung troubles by Oxygen its exhibition by inhalation is preferred. The apparatus herewith shown is a modification of the Nitrous Oxide apparatus which we have supplied for many years. It is made in the best manner throughout, and is the outcome of years of experience in the manufacture of gas apparatus. It will be found to meet all the requirements.

We supply the gas in two sizes of cylinders, containing respectively forty and one hundred gallons, either pure Oxygen, or a mixture of Oxygen and Nitrous Oxide in definite proportions of 20 per cent., and forty per cent. of Nitrous Oxide.

Whether pure or mixed the gas is sold at the uniform price of 5 cents a gallon. The cost of the cylinders will be refunded on their return empty with the valves in good condition. Full description of Inhalation and Enema apparatuses with directions for use accompany each apparatus, or will be supplied on application.

PRICES.

Inhalation Apparatus	$5.00
Cylinder, 40 gallons' capacity	6.00
40 gallons Gas, either pure Oxygen or mixed Oxygen and Nitrous Oxide	2.00
Complete Apparatus, Cylinder, and 40 gallons Gas	$13.00
Inhalation Apparatus	$5.00
Cylinder, 100 gallons' capacity	15.00
100 gallons Gas, either pure or mixed	5.00
Complete Apparatus, Cylinder, and 100 gallons Gas	$25.00

THE S. S. WHITE DENTAL MFG. CO.,

PHILADELPHIA, NEW YORK, BOSTON, CHICAGO, BROOKLYN, ATLANTA.

PREFERABLE TO CORROSIVE SUBLIMATE

Because it is not poisonous
Because it possesses superior antiseptic properties
Because it forms no insoluble compounds with the animal fluids
Because it produces no pain or irritation even of abraded surfaces

For use in all cases and under all circumstances where CORROSIVE SUBLIMATE has hitherto been employed

APPLICABLE WHEREVER AN ANTISEPTIC IRRIGATION or Lotion is indicated and as a Prophylactic and Disinfectant under any and all circumstances

CHLORO PHENIQUE

PERFECTLY MISCIBLE WITH WATER

For washing out the cavities, or THE BLADDER IN CHRONIC CYSTITIS it has no equal

A Non-Irritant Non-Poisonous Antiseptic and Parasiticide of Great Energy

In FOUL WOUNDS, ABSCESSES, SUPPURATING SINUSES, BUBOES, etc., CHLORO-PHÉNIQUE is used to cleanse and to prepare the way for "Campho-Phénique," which latter as a permanent dressing, subdues pain, prevents the formation of pus, and hastens healing in a remarkable manner

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

Scherff's Syrup of Hydriodic Acid.

A PERMANENT UNALTERABLE PREPARATION.

NON-IRRITANT. **PALATABLE.** **EFFICIENT**

Each fluid ounce of this Syrup represents the equivalent of 6.72 grains of absolute Hydriodic Acid. Particular stress is laid on the one great superiority: this Syrup **will not decompose**, and the danger (so common to other like preparations) of administering a preparation of free **iodine**, is absolutely avoided.

Western Pennsylvania Medical College.

Medical Department of the Western University of Pennsylvania.

The REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which, address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

The Baltimore Medical College.

PRELIMINARY FALL COURSE begins Sept. 1, 1892.
REGULAR WINTER COURSE begins October 1, 1892.

WALNUT LODGE HOSPITAL,

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. Each case comes under the direct personal care of the physician. Experience shows that a large per cent. of these cases are curable, and all are more or less benefitted from the application of exact hygienic and scientific measures. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE, and CURABLE, and all these cases require rest, change of thought and living, in the best surroundings, together with every means known to science and experience to bring about this result. Applications and all inquiries should be addressed

T. D. CROTHERS, M. D.,
Sup't Walnut Lodge, Hartford, Conn.

DR. MASSEY'S

PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

G. BETTON MASSEY, M. D.,
212 S. Fifteenth St., Philadelphia.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

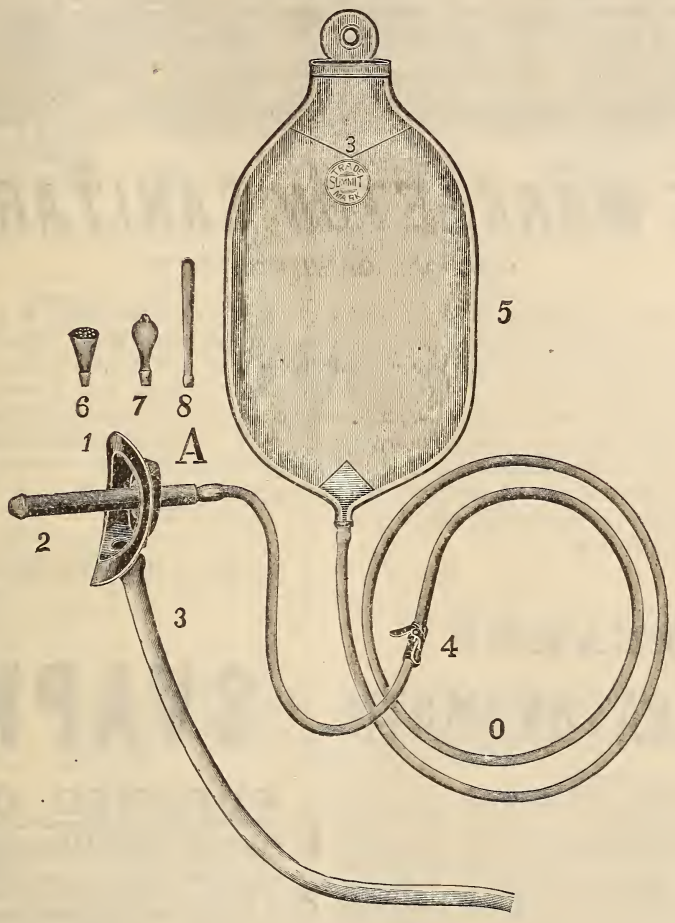
ST. LOUIS, MO.

MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.



AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.

Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.
No. 2—The Irrigating Tube.
No. 3—Large Waste Pipe.
No. 4—Stop Cock.
No. 5—Large Rubber Fountain Bag.
No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.
No. 6—Eye Spray.
No. 7—Nose and Ear Douche combined.
No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

THE MARKLETON SANITARIUM.

MARKLETON, SOMERSET COUNTY, PA.

Open all the year under the medical care of Dr. M. B. Gault and Mrs. Gault, M. D., the former with sixteen years' and the latter with seven years' experience in Sanitarium Work. Appointments first-class in every respect. While medicines are used whenever needed, the effort is made to meet all cases by the appliances of the House, as Hot and Cold Baths, Salt, Turkish, Roman, Sitz, Electro-chemical, Electro-thermal and Needle Baths, Swedish Movements, Massage, and Electricity in every form. Buildings heated by the hot water system, lighted by electricity, and supplied with pure mountain water; a quiet, restful place surrounded with beautiful mountain scenery; located on the Pittsburg Division of the B. & O. R. R., which connects with principal cities and at Johnstown and Connellsville with the P. R. R. Terms moderate. Discount for Ministers, Missionaries, Teachers, Physicians and their families.

For information, apply to—

DR. M. B. GAULT, Medical Director.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

THE SANITARIUM, BATTLE CREEK, MICHIGAN.

INCORPORATED, 1867.

The largest, most thoroughly equipped and one of the most favorably located in the United States. It is under strictly regular management. Eight physicians, well-trained and of large experience. A quiet, home-like place, where "trained nurses," "rest cure," "massage," "faradization," "galvanization," "static electrization," "Swedish movements," "dieting," "baths," "physical training," and all that pertains to modern rational medical treatment can be had in perfection at reasonable prices. **A special Hospital Building (150 Beds) for surgical cases with finest hospital facilities and appliances.**

Large Fan for Winter and Summer Ventilation. Absolutely Devoid of Usual Hospital Odors. Delightful Surroundings. Lake-side Resort. Pleasure Grounds. Steamers, Sail-boats, etc.

J. H. KELLOGG, M. D., Sup't, Battle Creek, Mich.

PURE GLUTEN BISCUIT

The undersigned have for several years been manufacturing a pure gluten for a few physicians. We are now prepared to furnish to the medical profession **the only pure gluten biscuit manufactured in America.** For samples and prices address

SANITARIUM FOOD CO., Battle Creek, Mich.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)		Soda.....1-3 Grains.	
Distilled Water.....35 "		Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.		Hyocholic Acid.....1-20 "	

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

C. N. CRITTENTON,

SOLE AGENT FOR THE UNITED STATES. 115 FULTON STREET, N. Y.

A Sample of Hydroleine will be sent free upon application, to any physician (enclosing business card) in the U. S.

THE ALE AND BEEF COMPANY, 267 W. 17th STREET, NEW YORK.

DEER PARK AND OAKLAND.

To those contemplating a trip to the mountains in search of health or pleasure, Deer Park, on the dome of the Alleghany Mountains, 3,000 feet above the sea level, offers such varied attractions as a delightful atmosphere during both day and night, pure water, smooth, winding roads through the mountains and valleys, and the most picturesque scenery in the Alleghany range. The hotel is equipped with such adjuncts conducive to the entertainment, pleasure and comfort of its guests, as Turkish and Russian Baths, swimming pools for both ladies and gentlemen, billiard rooms, superbly furnished parlors, and rooms single or en suite, an unexcelled cuisine and superior service.

The surrounding grounds as well as the hotel are lighted with electricity, have cosy and shady nooks, meandering walks, lawn tennis courts and grassy play grounds for children within full view of the inviting verandas. Six miles distant on the same mountain summit is Oakland, the twin resort of Deer Park, and equally as well equipped for the entertainment and accommodation of its guests. Both hotels are upon the main line of the Baltimore and Ohio Railroad, have the advantages of its splendid Vestibuled Limited Express trains between the East and West, and are, therefore, readily accessible from all parts of the country. Season Excursion tickets, good for return passage until October 31st, will be placed on sale at greatly reduced rates at all principal ticket offices throughout the country. One way tickets reading from St. Louis, Louisville, Cincinnati, Columbus, Chicago, and any point on B. & O. system to Washington, Baltimore, Philadelphia, or New York, or vice versa, are good to stop off at either Deer Park or Oakland, and the time limit will be extended by agents at either resort upon application.

The season at these popular resorts commenced June 22d.

For full information as to hotel rates, rooms, etc., address George D. DeShields, Manager, Deer Park or Oakland, Garrett County, Maryland.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid acid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Particularly applicable to conditions of **mal-nutrition.**

A reliable **tonic in convalescence** from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in **glandular enlargements, scrofulosis, imperfect bone formation** or **impairment of the central nervous system.** An easily appropriated and stable combination of the soluble **Wheat Phosphates** with **Muriate** of **Quinine, Iron** and **Strychnia.**

Of greater strength than the Various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince Street, New York.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

CHOLERA.

HORSFORD'S ACID PHOSPHATE.

By the researches of Koch and others, it is found that the cholera bacilli require for their growth, a mild alkaline nutrient medium, and that acids are most useful to kill them.

Horsford's Acid Phosphate has been successfully employed by the Physicians in Europe and America, and possesses special advantages over other acids, because of its beneficial action upon the nerves and process of digestion, and its tonic and general strengthening effect upon the whole system.

Half a teaspoonful in half a tumbler of water, with sugar if desired, will make a palatable drink.

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Prepared under the direction of Prof. E. N. HORSFORD, by the

7 Reasons why Papoid is superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S:& D.

Standard

1 to 6000.

A Soluble,

Non-Hygroscopic,

Inodorous,

Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1**;" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S,*" viz., "*Ext. Carnis Fl. Comp. (Colden.*" A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition."**

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

"Lithia in solution, as NATURE has PROVIDED, is practically better than any chemist has yet made."
N. Y. MEDICAL TIMES.

"If liquors are to be used no water is at once so agreeable for diluting them and so preventive of the bad consequences following their use."
H. M. JERNEGAN, M.D.,
Late Prof. Surgery, Boston University, Medical School.

(FROM PROF. HARE'S "PRACTICAL THERAPEUTICS.")

"In America the **lithia waters** are **fast displacing all others.** There seems to be good reason for this, as the very low equivalent of lithia gives it a much greater neutralizing power, weight for weight, than any other of the alkalies. For this reason it is effective in smaller quantity, and it follows that less demand is made upon the kidneys in excreting the resulting salts. The **principal lithia springs** are, in the order of their strength, the LONDONDERRY, the_____, and the_____."

Have You a Patient

With the *Consumption*, *Scrofula*, or any other *wasting* and *debilitating* disease?

If You Have,

Try Dr. Churchill's Treatment with the Hypophosphites of Lime and Soda, *uncombined* with other drugs. For *success* you need a chemically pure preparation, which you will find in *McArthur's Syrup*.

Prof. **HARVEY L. BYRD**, of Baltimore, wrote: "After two years' use of Dr. McArthur's Chemically Pure Syrup of the Hypophosphites, I do not hesitate to commend it to the profession as worthy of confidence."

If You Haven't

Used McArthur's Syrup we will send a bottle free to any physician willing to pay express charges, also interesting matter on the use of the Hypophosphites.

McArthur Hypophosphite Co.

Boston, Mass.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.

J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chrysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

"CURIOUS QUESTIONS."

An Encyclopaedia of the Rare and Curious.

Third Improved Edition Now Ready.

"Curious Questions" fills a niche wholly its own. Its mission is to tell you hundreds of things that you ought to know, and don't; to enlarge your conversational powers; to brighten your intellect, and lead you to further research in the best channels of thought, and to keep you from exposing your ignorance on many questions of daily recurrence.

Do not think you are too wise to profit by it, when Rev. Dr. Andrew Preston Peabody, of Harvard University, says of "Curious Questions:"

> **"I find that some of the questions are such as I could not have answered, or have known where to look for their answers. Such a book will be of inestimable service and value to any intelligent person, young or old."**

The new de luxe editions (25 full-page illustrations) are unexcelled for presentations. Prices, $4.00, $6.00 and $8.00 a set.

Sold by subscription through our regularly authorized solicitors, or supplied direct by the publishers. Illustrated descriptive catalogue and sample pages free. *Agents wanted.* Address the sole publishers,

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

Dysmenorrhœa

AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

ADDRESS: THE ANTIKAMNIA CHEMICAL COMPANY, ST. LOUIS, MO., U. S. A.

B. & O.'S NEW THROUGH LINE.

Preparing for the Immense Traffic Incident to the World's Fair.

The management of the Baltimore and Ohio Railroad is preparing for an immense business in 1893 while the World's Fair is open in Chicago. The terminals at Chicago are capable of accommodating a much heavier traffic than is now being done, and important changes are being arranged for the handling of very heavy freight and passenger business to the West from New York, Philadelphia and Baltimore. New equipment for largely increased passenger business and an extensive stock of freight cars have been ordered.

The various roads of the system will be improved by straightened lines, reduced grades, extra side tracks, and interlocking switches.

The new line between Chicago Junction and Akron has shortened the distance between Chicago and tide water twenty-five miles, and between Pittsburgh and Chicago fifty-eight miles.

The distance between Chicago and Pittsburgh and Chicago and Cleveland by the construction of the Akron line and the acquisition of the Pittsburgh and Western line and the Valley Railroad of Ohio, is about the same as via the Lake Shore from Cleveland to Chicago, and by the Pennsylvania from Pittsburgh to Chicago. The alignment is to be changed and grades reduced to a maximum of twenty-six feet. It is expected that within twelve months the old Baltimore & Ohio through line between Chicago and the Atlantic Ocean will have passed away and the new line via Pittsburgh be established with no greater grades or curvatures than on any of the trunk lines.

Work has already begun east of Pittsburgh to meet improvements making west of Pittsburgh. These improvements will consist of additional second and third tracks, a general correction of the alignment, and completion of the double track on the Metropolitan Branch.

It is expected that the new through line will be ready simultaneously with the completion, of the Belt Line through the City of Baltimore which is intended to unite the Washington Branch with the Philadelphia Division and do away with the present line via Locust Point.

Forty new and powerful locomotive engines were added to the equipment during the last two months, and others are in process of construction. The permanent improvements now under way and in contemplation involve the expenditure of some five millions of dollars. —*Baltimore American.*

Vaccine Matter.

For the accommodation of our Subscribers, we will supply both Bovine and Humanized Vaccine Virus.

Guaranteed to be fresh and in every respect first-class.

PRICES:

Bovine Crusts,	**$1.50 each.**
Bovine Points or Quills,	**1.00 a dozen.**
Humanized Crusts,	**1.00, small.**
Humanized Crusts,	**2.00, large.**

The Humanized Crusts are warranted to be from typical cases, and in every instance from healthy children, with unquestionable family histories.

Please accompany the Order with the Money.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

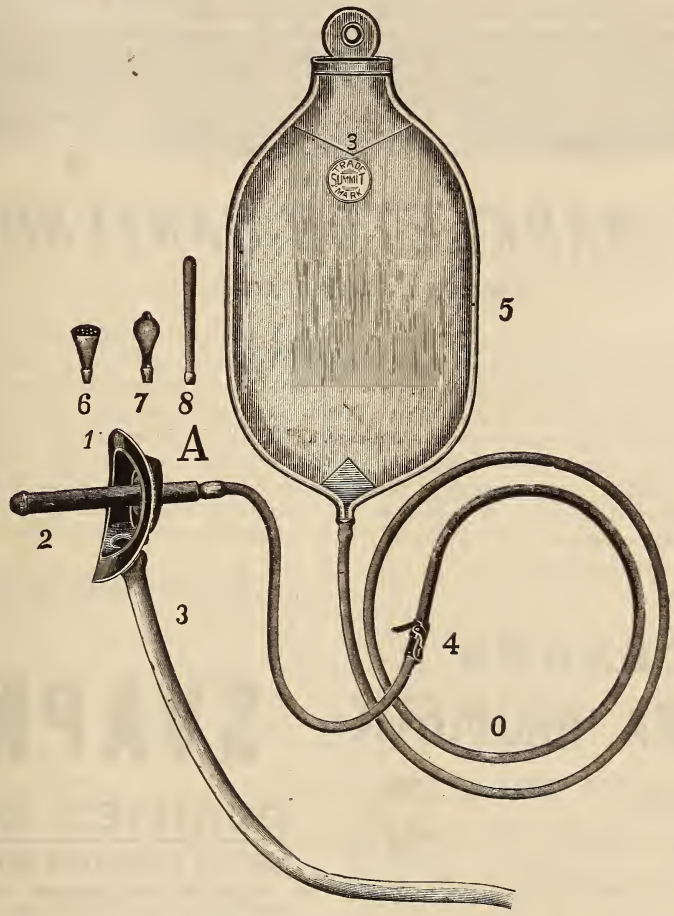
ST. LOUIS, MO.

MRS. FOOTE'S NEW SYRINGE AND URINAL FOR LADIES.

PATENTED.

A NEW AND INGENIOUS DEVICE, PERFECT IN ITS DESIGN AND OPERATION.



AMONG PHYSICIANS IT HAS MET WITH UNIVERSAL APPROVAL AND COMMENDATION.

Letter *A* represents the syringe with the movable irrigating tube passing through a soft rubber packing in the top of the shield arranged for a syringe and showing all the attachments.

No. 1—The Shield.
No. 2—The Irrigating Tube.
No. 3—Large Waste Pipe.
No. 4—Stop Cock.
No. 5—Large Rubber Fountain Bag.
No. 0—The Supply Pipe, full ¼ inch diameter inside measure, carrying a large force of water.
No. 6—Eye Spray.
No. 7—Nose and Ear Douche combined.
No. 8—Rectum Tube.

The shield can be used as a plain urinal, for the very sick in bed without the fountain bag, by substituting a cork in place of the irrigating tube. The patient need not be lifted at all. The urinal will work perfectly on females of any age, keeping the bed-clothes clean and dry. This can be sold separately.

RECOMMENDED BY THE MOST EMINENT PHYSICIANS, AND NOW IN USE IN ALL THE PRINCIPAL HOSPITALS IN NEW YORK.

The Syringe and Urinal will be sent, charges paid, by mail or express, packed securely in a neat box, to any part of the city, United States or Canada, on receipt of the price, $5.00, which amount may be sent more safely by a postal money order or draft on New York.

THE B. F. GOODRICH CO.

PRICE, $5.00.

SOLE MANUFACTURERS,

AKRON, OHIO.

THE MARKLETON SANITARIUM.

MARKLETON, SOMERSET COUNTY, PA.

Open all the year under the medical care of Dr. M. B. Gault and Mrs. Gault, M. D., the former with sixteen years' and the latter with seven years' experience in Sanitarium Work. Appointments first-class in every respect. While medicines are used whenever needed, the effort is made to meet all cases by the appliances of the House, as Hot and Cold Baths, Salt, Turkish, Roman, Sitz, Electro-chemical, Electro-thermal and Needle Baths, Swedish Movements, Massage, and Electricity in every form. Buildings heated by the hot water system, lighted by electricity, and supplied with pure mountain water; a quiet, restful place surrounded with beautiful mountain scenery; located on the Pittsburg Division of the B. & O. R. R., which connects with principal cities and at Johnstown and Connellsville with the P. R. R. Terms moderate. Discount for Ministers, Missionaries, Teachers, Physicians and their families.

For information, apply to—

DR. M. B. GAULT, Medical Director.

STEARNS'
CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

THE BEST FRENCH TONIC

Vin de Bugeaud

A TONIC AND NUTRITIVE WINE WITH CINCHONA AND COCOA

VIN DE BUGEAUD is prepared with the greatest care, with active substances of the very best quality, and chiefly with wild Bolivian Cinchona, the cultivated species being strictly discarded, and the proportions being precisely in accordance with the French pharmacopœa.

It is perfectly tolerated by the most delicate stomachs, owing to the emollient action of the Cocoa it contains, which favourably corrects the over exciting properties and the bitter taste of the Cinchona.

In preparing it, a full-bodied Spanish wine is employed, this wine being more than any other capable of dissolving the medicinal ingredients.

VIN DE BUGEAUD commends itself to the medical profession oth by its tonic and antiperiodic properties, and by the certainty nd continuity of its action in cases of

Anæmia, Chlorosis, Intermittent Fever, Chronic Diarrhœa, Gastralgia, Convalescences,

in a word to combat

Constitutional or Accidental Debility

no matter from what cause arising.

It is specially suitable for convalescents, debilitated children, delicate women and old persons enfeebled by age and infirmities.

VIN DE BUGEAUD has enjoyed since 1858 the high approbation of the New-York Academy of Medicine. Thousands of practitioners of all countries have spontaneously borne testimony to its efficacy.

Professionnal gentlemen are invited to apply for a copy of the pamphlet (sent free on demand) which contains, along with a few remarks on **VIN DE BUGEAUD** and the opinions of the French medical press on the subject, a number of the most recent testimonials.

VIN DE BUGEAUD may be obtained of all good Chemists and Druggists.

JOUR. OF BALNEOLOGY.

"Best of all the natural waters as an anti-lithic."
G. FRANK LYDSTON, M. D.,
Prof of Genito-Urinary Diseases, Chicago College Physicians and Surgeons.

"I depend upon 'Londonderry' invariably, and often as a last resource."
HENRY M. FIELD, M. D.,
Prof. Therapeutics, Dartmouth Medical College.

"Best of all the spring waters of an alkaline nature containing LITHIA and other URIC ACID solvents."
MORRIS H. HENRY, M.D., M.A., LL.D.,
Author Treatise on Gout, etc., N. Y.

"Effects of the water speak more eloquently than any words which I might utter."
I. N. DANFORTH, M.D.,
Prof. Pathology and Renal Diseases, Woman's Med. College, Chicago.

"Lithia in solution, as NATURE has PROVIDED, is practically better than any chemist has yet made."
N. Y. MEDICAL TIMES.

"If liquors are to be used no water is at once so agreeable for diluting them and so preventive of the bad consequences following their use."
H. M. JERNEGAN, M.D.,
Late Prof. Surgery, Boston University, Medical School.

(FROM PROF. HARE'S "PRACTICAL THERAPEUTICS.")

"In America the **lithia waters** are **fast displacing all others.** There seems to be good reason for this, as the very low equivalent of lithia gives it a much greater neutralizing power, weight for weight, than any other of the alkalies. For this reason it is effective in smaller quantity, and it follows that less demand is made upon the kidneys in excreting the resulting salts. The **principal lithia springs** are, in the order of their strength, the LONDONDERRY, the _____, and the _____."

Stability an Essential Quality
To a Perfectly Prepared Pill.

However Perfect a Pharmaceutical Preparation may seem to be when in the laboratory, it can have no practical value unless it possesses the properties necessary to its continuous conservation.

Instability in pill preparations may be due to one or more of the following causes:

IMPURE CHEMICALS
INEXACT PROPORTIONS
INCOMPATIBLE INGREDIENTS
IMPROPER EXCIPIENTS
IMPERFECT INCORPORATION
INAPPROPRIATE COATING
INADEQUATE FINISHING

Impure Chemicals are inadmissible because a single foreign body may bring about a destructive reaction. **Inexact Proportions** may cause trouble because pills are often designed to present nascent drugs to the economy and their changes must be carefully considered. **Incompatible Ingredients** work injury at the time of preparation and afterward. **Improper Excipients** induce deterioration by aiding or causing chemical changes. **Imperfect Incorporation** precludes uniformity. **An Inappropriate Coating** exposes the pill to atmospheric influences; and **Inadequate Finishing** operates to the same end.

In the Preparation of the W. H. S. & Co. Pill, all of these points are taken into careful consideration. Hence they may be confidently prescribed.

In a Future Note we will offer a recapitulation of what we have said on this subject. **Meanwhile,** we ask attention to the following seasonable remedies:

Pil. Phenacetine et Salophen, 5 grs., "W. H. S. & Co."

For Influenza (*"la grippe"*), **Acute, Articular Rheumatism, Neuralgia, Migraine, Pertussis,** and all **Painful Febrile Conditions** whether or not dependent upon a **Rheumatic Diathesis.** [Pills of 2 1-2 and 5 grs. each, of equal parts of salophen and phenacetine.]

Pil. Salol, "W. H. S. & Co."

For Dysentery, Diarrhœa, Typhoid Fever, Rheumatism and **Rheumatoid Affections** in general. In **Bowel Troubles** it acts as a **Safe** and **Efficient Antiseptic.** [Pills of 2 1-2 and 5 grs. each; dose 2 1-2 to 15 grs.]

Pil. Tinct. Warburgi, "W. H. S. & Co."

For Malarial Fever, Warburg's Tincture gives results not always to be obtained from other remedies. It is of **especial value** in overcoming the element of **Periodicity.** [Each pill represents one drachm of the tincture. We also prepare a pill of half streng

Pil. Arsenici Sulphidi, "W. H. S. & Co."

For Diseases of the Skin amenable to **Arsenical Treatment.** Has given **Curative Results** in **Eczema, Acne, Furunculus,** etc., and has favorably controlled **Psoriasis.** [Pills of 1-100 gr., 1-50 gr. and 1-30 gr.]

Pil. Quiniæ, Ferri et Zinci Valerianat., "W. H. S. & Co."

For Nervous Strain, Melancholia, Epilepsy, Hysteria, Delirium Tremens, Dysmenorrhœa and the **Neuroses** arising from **Over-Anxiety.** [Pills of 3 grs. containing equal parts of each salt.]

W. H. Schieffelin & Co., New York.

"COMING OUR WAY."

THE WM. S. MERRELL CHEMICAL CO., are the original, the largest and practically the ONLY manufacturers of True Salicylic Acid from Natural Wintergreen Oil; and the lack of faith—amounting to practical unbelief—in the necessity for careful specification, has enabled unprincipled or incompetent makers to market their product and supply that class of buyers who believe in something "cheap," especially if assured by interested distributors that "it is just as good."

READ THIS!

A Salicylic Uncertainty.

A warning key-note struck by an unprejudiced and disinterested writer in favor of high qualities and positive therapeutics

The fact that a synthetic chemical gives reactions apparently identical with its native prototype does not establish indentity of physiological action. Even the natural alkaloid caffeine has been shown by clinical experiment to differ in its action when derived from different plants.

Charteris and others have shown that salicylic acid obtained from oil of wintergreen differs in its therapeutic effects from that made by synthesis, and physicians sometimes insist on having the former kind, which is much more expensive.

But artificial oil of wintergreen has become quite common. It is made by combining artificial salicylic acid with the methyl radical of methyl alcohol. Now, it is said that certain manufacturers have adopted the idea of using this artificial oil for the production of salicylic acid; that is, they juggle with what remnants of conscience they may have, by taking artificial salicylic acid out of a compound into which they or somebody else has put it, and calling this "acid from the oil."

This circumstance will lead to confusion as to the real source of a given salicylic acid and we regret to have to admit that there are probably some dealers who will resort to the subterfuge of supplying "acid from the oil," when they know that the oil was not the natural product. So where such acid is desired, the pharmacist must demand of his dealer a guarantee extending to the oil itself.

Editorial Druggist's Circular,
May, 1892.

The best dispensers always specify "MERRELL'S."

True Salicylic Acid } From Natural
True Salicylate Sodium } Wintergreen Oil.

The **"Merrell Co."** do not sell, use or handle Synthetic Oil Wintergreen or acid made from it.

The **"Merrell Co."** do not "rub up" Commercial Salicylic Acid with a little Oil Wintergreen and call it Salicylic Acid from Wintergreen Oil, and recommend the "light feathery crystals" thus produced as the "proper thing."

The **"Merrell Co."** do not claim that True Salicylic Acid has "a slight odor of the oil"—for when pure and properly prepared, it has an odor peculiarly its own, but it is not a Wintergreen odor.

Crystals of True Salicylic Acid are large, firm and hard—from ¼ to ¾ inch long, of measurable thickness, and much heavier in a given bulk than acid prepared "in a mortar" from Synthetic Oil and Commercial Acid.

THE WM. S. MERRELL CHEMICAL CO.

NEW YORK. BOSTON. CINCINNATI.

OR MAY BE ORDERED THROUGH WHOLESALE DRUGGISTS IN ANY PROMINENT DISTRIBUTING CENTRE.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system. and thus relieves all abnormal conditions.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

HENRY B. PLATT, 36 Platt St., N. Y.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . . 1 gr. | Concentrated Pepsin 1gr.
Ext. Nux Vomica . . ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is superior to Pepsin

1 Digestive Power

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 Acts Throughout Entire Alimentary Canal

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 Stimulates Natural Digestion

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not."
(LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 Acts in Acid, Alkaline, or Neutral Media

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers read before Philadelphia County Medical Society.)

5 Acts on All Kinds of Food. Can be Combined with Antiseptics

"The physiological actions of Papoid as a digestive agent have been thoroughly established It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 Acts in the Intestines

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 Costs Less

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

B. & O.'S NEW THROUGH LINE.

Preparing for the Immense Traffic Incident to the World's Fair.

The management of the Baltimore and Ohio Railroad is preparing for an immense business in 1893 while the World's Fair is open in Chicago. The terminals at Chicago are capable of accommodating a much heavier traffic than is now being done, and important changes are being arranged for the handling of very heavy freight and passenger business to the West from New York, Philadelphia and Baltimore. New equipment for largely increased passenger business and an extensive stock of freight cars have been ordered.

The various roads of the system will be improved by straightened lines, reduced grades, extra side tracks, and interlocking switches.

The new line between Chicago Junction and Akron has shortened the distance between Chicago and tide water twenty-five miles, and between Pittsburgh and Chicago fifty-eight miles.

The distance between Chicago and Pittsburgh and Chicago and Cleveland by the construction of the Akron line and the acquisition of the Pittsburgh and Western line and the Valley Railroad of Ohio, is about the same as via the Lake Shore from Cleveland to Chicago, and by the Pennsylvania from Pittsburgh to Chicago. The alignment is to be changed and grades reduced to a maximum of twenty-six feet. It is expected that within twelve months the old Baltimore & Ohio through line between Chicago and the Atlantic Ocean will have passed away and the new line via Pittsburgh be established with no greater grades or curvatures than on any of the trunk lines.

Work has already begun east of Pittsburgh to meet improvements making west of Pittsburgh. These improvements will consist of additional second and third tracks, a general correction of the alignment, and completion of the double track on the Metropolitan Branch.

It is expected that the new through line will be ready simultaneously with the completion, of the Belt Line through the City of Baltimore which is intended to unite the Washington Branch with the Philadelphia Division and do away with the present line via Locust Point.

Forty new and powerful locomotive engines were added to the equipment during the last two months, and others are in process of construction. The permanent improvements now under way and in contemplation involve the expenditure of some five millions of dollars. —*Baltimore American.*

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation,* its great digestive power, its permanency, *its perfect solubility,* and its *reasonable price,* the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

ABOUT GAS TREATMENT.

We make and sell oxygen and nitrogen monoxide for therapeutic use, and we guarantee them pure They are put up in compact form. (A cylinder containing 100 gallons of nitrogen monoxide or 40 gallons of oxygen measures 12 inches in length, has a diameter of 3½ inches, and weighs 10½ lbs. A cylinder containing 450 gallons of nitrogen monoxide or 100 gallons of oxygen measures 25 inches in length, has a diameter of 4½ inches, and weighs 34 lbs.)

INSOMNIA. Dr. Allan McLane Hamilton states that nitrogen monoxide, N_2O (nitrous oxide of the old nomenclature) has no equal in the treatment of this difficulty.

MELANCHOLIA. A short course of nitrogen monoxide is said to change the face of nature for such patients.

ANÆMIA. Where iron is not tolerated or proves inefficient, the addition of oxygen or a combination of oxygen and nitrogen monoxide has proven very beneficial.

For those who should, but cannot, go from home for rest or a change of air, or for those who, from any cause fail to get air enough into their lungs, the inhalation of one or other of these gases, or both in combination, promises great benefit. The testimony is that in cases of

ASTHMA, more than fifty per cent. of the cases yield to oxygen treatment, others are very greatly relieved, and a very small per cent. are not improved.

INDIGESTION and CONSTIPATION are said to be greatly relieved and very often conquered by continued treatment.

A highly esteemed New York physician has used more than twenty thousand gallons of nitrogen monoxide in his private practice. The letters received from his patients, largely from those who were afflicted with nervous disorders, are enthusiastic in their testimony as to the benefit received.

Regular practitioners who are using gas treatment testify that when *pure* oxygen and *pure* nitrogen monoxide, or a mixture of these, is used, no therapeutic agents are more uniformly successful when intelligently prescribed.

Prickly Heat, Chafing, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.--

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil	80 m. (drops)	Soda	1-3 Grains
Distilled Water	35 "	Salicylic Acid	1-4 "
Soluble Pancreatin	5 Grains.	Hyocholic Acid	1-30 "

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which HYDROLEINE is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

C. N. CRITTENTON,

SOLE AGENT FOR THE UNITED STATES. 115 FULTON STREET, N. Y.

A Sample of Hydroleine will be sent free upon application, to any physician (enclosing business card) in the U. S.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

BUFFALO LITHIA SPRINGS, VA.

"LONDONDERRY!"

"The most wonderful American Water."
JOUR. OF BALNEOLOGY.

"Best of all the natural waters as an anti-lithic."
G. FRANK LYDSTON, M. D.,
Prof of Genito-Urinary Diseases, Chicago College Physicians and Surgeons.

"I depend upon 'Londonderry' invariably, and often as a last resource."
HENRY M. FIELD, M. D.,
Prof. Therapeutics, Dartmouth Medical College.

"Best of all the spring waters of an alkaline nature containing LITHIA and other URIC ACID solvents."
MORRIS H. HENRY, M.D., M.A., LL.D.,
Author Treatise on Gout, etc., N. Y.

"Effects of the water speak more eloquently than any words which I might utter."
I. N. DANFORTH, M.D.,
Prof. Pathology and Renal Diseases, Woman's Med. College, Chicago.

"Lithia in solution, as NATURE has PROVIDED, is practically better than any chemist has yet made."
N. Y. MEDICAL TIMES.

"If liquors are to be used no water is at once so agreeable for diluting them and so preventive of the bad consequences following their use."
H. M. JERNEGAN, M.D.,
Late Prof. Surgery, Boston University, Medical School.

(FROM PROF. HARE'S "PRACTICAL THERAPEUTICS.")

"In America the **lithia waters** are **fast displacing all others.** There seems to be good reason for this, as the very low equivalent of lithia gives it a much greater neutralizing power, weight for weight, than any other of the alkalies. For this reason it is effective in smaller quantity, and it follows that less demand is made upon the kidneys in excreting the resulting salts. The **principal lithia springs** are, in the order of their strength, the LONDONDERRY, the_____, and the_____."

Have You a Patient

With the *Consumption*, *Scrofula*, or any other *wasting* and *debilitating* disease?

If You Have,

Try Dr. Churchill's Treatment with the Hypophosphites of Lime and Soda, *uncombined* with other drugs. For *success* you need a chemically pure preparation, which you will find in *McArthur's Syrup.*

Prof. HARVEY L. BYRD, of Baltimore, wrote: "After two years' use of Dr. McArthur's Chemically Pure Syrup of the Hypophosphites, I do not hesitate to commend it to the profession as worthy of confidence."

If You Haven't

Used McArthur's Syrup we will send a bottle free to any physician willing to pay express charges, also interesting matter on the use of the Hypophosphites.

McArthur Hypophosphite Co.

Boston, Mass.

Before the Medical Profession almost 30 years, and invariably gives uniform satisfaction.

We respectfully ask thorough testing, strictly UPON ITS OWN MERITS, to prove the exceptionally high reputation it holds

Owing to correspondence on the subject, we regret being compelled to caution that inferior Coca preparations are frequently substituted upon patients, and, as we do not advertise to the public, physicians will kindly be particular to insist on

VIN MARIANI

FORMULA: "VIN MARIANI" is the concentrated extractive of the fresh leaf Erythroxylon Coca, blended with a special quality of Bordeaux Wine. Each half-litre bottle contains the medicinal properties of two ounces of selected leaves.

DOSE: Usually a wine-glassful three times a day, half an hour before meals or immediately after. Increased or diminished, at discretion of the Physician.

INDICATED: As a pleasant, mild stimulant, without unpleasant reaction; a diffusible tonic; a strengthener of the Nervous system, with especial good effect on the digestive and respiratory organs; convalescence and enfeebled conditions. Effect is immediate and lasting.

NOTE: Extensively used in Hospitals, Cliniques and private practice, its merits are recorded by the medical press of Europe and America. Uniform excellence and recognized efficacy won the absolute confidence and esteem of every physician who subjected it to test, and it may be affirmed that wherever Coca is indicated "Vin Mariani" invariably receives the preference.

The continual increasing demand is a clear proof of the reliance placed in "Vin Mariani" by the Medical Profession, through whom it has been popularized.

WE WILL BE HAPPY TO FORWARD, POST-PAID, TO ANY PHYSICIAN MENTIONING THIS JOURNAL, A HANDSOMELY BOUND BOOK, DETAILING FORMULÆ, DOSE, PHYSIOLOGICAL EFFECTS AND THERAPEUTIC INDICATIONS OF COCA, AS ALSO OTHER INTERESTING READING MATTER CONNECTED WITH THE SUBJECT BY EUROPEAN AND AMERICAN OBSERVERS.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

Send for catalogue, and address

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE AND CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16 page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G. T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. **A NON-ALCOHOLIC LIQUID.** WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

NEW YORK
CHICAGO

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

Introduced to the Medical and the Pharmaceutical professions by J. FEHR, in the year 1873.

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER BOX, PLAIN, 25 Cents; PERFUMED, 50 Cents.
PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

SOLD BY THE DRUG TRADE GENERALLY.

MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

STEARNS'
CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation.) of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

"LONDONDERRY"

"The most wonderful American Water."
JOUR. OF BALNEOLOGY.

"Best of all the natural waters as an anti-lithic."
G. FRANK LYDSTON, M. D.,
Prof of Genito-Urinary Diseases, Chicago College Physicians and Surgeons

"I depend upon 'Londonderry' invariably, and often as a last resource."
HENRY M. FIELD, M. D.,
Prof. Therapeutics, Dartmouth Medical College.

"Best of all the spring waters of an alkaline nature containing LITHIA and other URIC ACID solvents."
MORRIS H. HENRY, M.D., M.A., LL.D.,
Author Treatise on Gout, etc., N. Y.

"Effects of the water speak more eloquently than any words which I might utter."
I. N. DANFORTH, M.D.,
Prof. Pathology and Renal Diseases, Woman's Med. College, Chicago.

"Lithia in solution, as NATURE has PROVIDED, is practically better than any chemist has yet made."
N. Y. MEDICAL TIMES.

"If liquors are to be used no water is at once so agreeable for diluting them and so preventive of the bad consequences following their use."
H. M. JERNEGAN, M.D.,
Late Prof. Surgery, Boston University, Medical School.

(FROM PROF. HARE'S "PRACTICAL THERAPEUTICS.")

"In America the **lithia waters** are **fast displacing all others.** There seems to be good reason for this, as the very low equivalent of lithia gives it a much greater neutralizing power, weight for weight, than any other of the alkalies. For this reason it is effective in smaller quantity, and it follows that less demand is made upon the kidneys in excreting the resulting salts. The **principal lithia springs** are, in the order of their strength, the LONDONDERRY, the_____, and the_____."

GENITO-URINARY DISEASES

True Santal and Palmetto in a pleasant aromatic vehicle.

Dose—Teaspoonful four times a day—

SANMETTO

SPECIAL

PRE-SENILITY,
Prostatic Trouble,
IRRITABLE BLADDER,
Urethral Inflammation.

OD CHEM. CO., NEW YORK.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

7 Reasons why Papoid is superior to Pepsin

1 Digestive Power

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 Acts Throughout Entire Alimentary Canal

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 Stimulates Natural Digestion

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 Acts in Acid, Alkaline, or Neutral Media

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 Acts on All Kinds of Food. Can be Combined with Antiseptics

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 Acts in the Intestines

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 Costs Less

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

B. & O.'S NEW THROUGH LINE.

Preparing for the Immense Traffic Incident to the World's Fair.

The management of the Baltimore and Ohio Railroad is preparing for an immense business in 1893 while the World's Fair is open in Chicago. The terminals at Chicago are capable of accommodating a much heavier traffic than is now being done, and important changes are being arranged for the handling of very heavy freight and passenger business to the West from New York, Philadelphia and Baltimore. New equipment for largely increased passenger business and an extensive stock of freight cars have been ordered.

The various roads of the system will be improved by straightened lines, reduced grades, extra side tracks, and interlocking switches.

The new line between Chicago Junction and Akron has shortened the distance between Chicago and tide water twenty-five miles, and between Pittsburgh and Chicago fifty-eight miles.

The distance between Chicago and Pittsburgh and Chicago and Cleveland by the construction of the Akron line and the acquisition of the Pittsburgh and Western line and the Valley Railroad of Ohio, is about the same as via the Lake Shore from Cleveland to Chicago, and by the Pennsylvania from Pittsburgh to Chicago. The alignment is to be changed and grades reduced to a maximum of twenty-six feet. It is expected that within twelve months the old Baltimore & Ohio through line between Chicago and the Atlantic Ocean will have passed away and the new line via Pittsburgh be established with no greater grades or curvatures than on any of the trunk lines.

Work has already begun east of Pittsburgh to meet improvements making west of Pittsburgh. These improvements will consist of additional second and third tracks, a general correction of the alignment, and completion of the double track on the Metropolitan Branch.

It is expected that the new through line will be ready simultaneously with the completion, of the Belt Line through the City of Baltimore which is intended to unite the Washington Branch with the Philadelphia Division and do away with the present line via Locust Point.

Forty new and powerful locomotive engines were added to the equipment during the last two months, and others are in process of construction. The permanent improvements now under way and in contemplation involve the expenditure of some five millions of dollars. —*Baltimore American.*

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1,"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden."* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. ***Sold by druggists generally.***

C. N. CRITTENTON, General Agent, 115 Fulton St., New York.

GLENN'S SULPHUR SOAP.

BEWARE OF COUNTERFEITS.

Physicians know the great value of the local use of Sulphur in the Treatment of Diseases of the Skin.

Constantine's Pine-Tar Soap.

THE BEST SOAP MADE.

Has been on trial among physicians for very many years as a healing agent. By far the Best Tar Soap made.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton St, New York.

Samples of above Soaps SENT FREE, on application, to any Physician enclosing card

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia, President of the National Board of Health, etc., etc.,* says:—

"The Buffalo Lithia Water Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition."**

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

BUFFALO LITHIA SPRINGS, VA.

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

Have You a Patient

With the *Consumption*, *Scrofula*, or any other *wasting* and *debilitating* disease?

If You Have,

Try Dr. Churchill's Treatment with the Hypophosphites of Lime and Soda, *uncombined* with other drugs. For *success* you need a chemically pure preparation, which you will find in *McArthur's Syrup*.

Prof. HARVEY L. BYRD, of Baltimore, wrote: "After two years' use of Dr. McArthur's Chemically Pure Syrup of the Hypophosphites, I do not hesitate to commend it to the profession as worthy of confidence."

If You Haven't

Used McArthur's Syrup we will send a bottle free to any physician willing to pay express charges, also interesting matter on the use of the Hypophosphites.

McArthur Hypophosphite Co.

Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.

J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed

T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Prof. v. Nussbaum.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation,* its great digestive power, its permanency, *its perfect solubility,* and its *reasonable price,* the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

THE BEST FRENCH TONIC

Vin de Bugeaud

A TONIC AND NUTRITIVE WINE WITH CINCHONA AND COCOA

VIN DE BUGEAUD is prepared with the greatest care, with active substances of the very best quality, and chiefly with wild Bolivian Cinchona, the cultivated species being strictly discarded, and the proportions being precisely in accordance with the French pharmacopœa.

It is perfectly tolerated by the most delicate stomachs, owing to the emollient action of the Cocoa it contains, which favourably corrects the over exciting properties and the bitter taste of the Cinchona.

In preparing it, a full-bodied Spanish wine is employed, this wine being more than any other capable of dissolving the medicinal ingredients.

VIN DE BUGEAUD commends itself to the medical profession both by its tonic and antiperiodic properties, and by the certainty and continuity of its action in cases of

Anæmia, Chlorosis, Intermittent Fever, Chronic Diarrhœa, Gastralgia, Convalescences,

in a word to combat

Constitutional or Accidental Debility

no matter from what cause arising.

It is specially suitable for convalescents, debilitated children, delicate women and old persons enfeebled by age and infirmities.

VIN DE BUGEAUD has enjoyed since 1858 the high approbation of the New-York Academy of Medicine. Thousands of practitioners of all countries have spontaneously borne testimony to its efficacy.

Professionnal gentlemen are invited to apply for a copy of the pamphlet (sent free on demand) which contains, along with a few remarks on **VIN DE BUGEAUD** and the opinions of the French medical press on the subject, a number of the most recent testimonials.

VIN DE BUGEAUD may be obtained of all good Chemists and Druggists.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

DR. S. E. STRONG, THE SANITARIUM, 90 CIRCULAR ST.

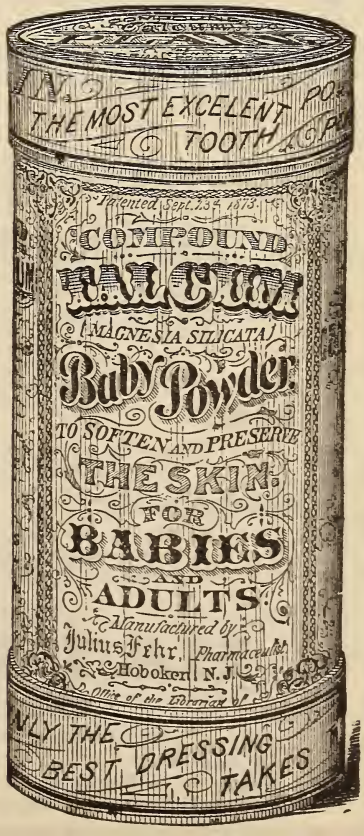
JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.



BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid.* They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always he freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The Secret of its Success

(we refer to MERCK'S BULLETIN) is its distinctive character. Some journals are devoted to the expansion of a single man's ideas or the advancement of a special theory. MERCK'S BULLETIN is a comprehensive, well-rounded, clearly-outlined review of the entire field. It offers just what the busy physician or surgeon desires to know. This is the reason that many hundreds of new names are added every month to its subscription list.

If you do not know the journal and want to examine it, a copy will be cheerfully forwarded without expense.

New York

Sole Agents and Sole Licensees for the United States

ARISTOL is now widely used as an agreeable and effective dressing in all of the operations of major and minor surgery and in dentistry. It is invaluable in ulcerations of all kinds, and in burns, blisters and bed-sores. It adheres closely to mucous membranes and wound surfaces. (*Aristol and "Europhen-Aristol" a combination of both remedies, are supplied in ounces.*)

EUROPHEN is a complete substitute for iodoform and is a cicatrisant, of special value in specific lesions, catarrhal and ulcerative diseases and all surgical conditions formerly treated by the latter preparation. It has five times the covering power of iodoform and forms an impervious coating over denuded tissues. Europhen has a faint, agreeable odor resembling that of saffron. (*Supplied in ounces.*)

SALOPHEN is a new salicylo-phenolic derivative said to be so combined, chemically, as to constitute a safer and more effective remedy than either of its components, or any analagous preparation. The reports refer in the highest terms to its value in acute articular rheumatism and allied affections. Competent observers recommend it for trial. (*Supplied in ounces, tablets and pills.*)

SULFONAL induces physiological sleep, free from narcosis, and without sequelæ. It acts purely as a hypnotic and claims no analgic powers. Sulfonal is also of the highest value in the neuroses and is largely employed by neurologists. It is a perfectly safe and reliable remedy and its continuous use does not give rise to a drug habit. Sulfonal must be administered according to directions. (*Supplied in ounces, tablets and pills.*)

PHENACETINE continues to justify the high commendations of physicians, and it may properly be considered as the best of the modern antipyretics and anodynes. In *la grippe*, rheumatism, migraine, neuralgia and allied maladies it is a prompt, safe and effective remedy. Phenacetine, unlike the secret mixtures announced as analgesics and antipyretics, is a true organic derivative. (*Supplied in ounces, tablets and pills.*)

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia: twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of child birth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M. D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M. D., LL. D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcemcnt and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

John Cleland.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment.

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chrysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up" This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co 's Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich U. S. P. We take very great pleasure in asking physicians to prescribe t em more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Ginger ne . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indige-tion, and will afford permanent benefit in cases of enfeebled d gestion, where the gastric juices are not pro erly secreted. As a dinner pill, Pil Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . . 1 gr. | Concentrated Pepsin 1gr.
Ext. Nux Vomica . . ⅛ gr | Dose—1 to 3 pills.

Pil. Antiseptic Comp is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not."
(LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from sentic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

Packer's Tar Soap

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)	Soda.....1-3 Grains.		Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.
Distilled Water.....35 "	Salicylic Acid.....1-4 "		
Soluble Pancreatin..... 5 Grains.	Hyocholic Acid.....1-30 "		

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which HYDROLEINE is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable,-supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W Wilcox, M. A., M D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid.* They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always he freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $5.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.
Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Julius Dreschfeld.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the deqsuamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

McKESSON & ROBBINS, NEW YORK.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system. and thus relieves all abnormal conditions.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

Nervous Diseases and Their Diagnosis

By H. C. WOOD, M. D., LL. D.,

Professor of Therapeutics and Nervous Diseases, University of Pennsylvania.
8vo., pp. 501, Cloth, $4.

It is invaluable as a work of diagnosis.—*Virginia Medical Monthly.*

It is at once a substantive contribution to neurology and a trustworthy guide to what has already been done in the subject.—*Practitioner.*

As a whole, the work is one which cannot fail to be of great service to the practicing physician.—*Medical and Surgical Reporter.*

The volume is a distinct help to the student, and is a necessary supplement to the systematic works on diseases of the nervous system.—*Boston Med. Surg. Jour.*

The author's originality is evident to every reader of his work; and we trust, for the advancement of knowledge, his readers will be many.—*New England Med. Gaz.*

This work fills a long-felt need in this department.—*Buffalo Med. Surg. Jour.*

Dr. Wood is an able clinician, and this makes his book valuable. His observations are practical and to the point and show careful study of a large number of cases which have fallen under his care.—*N. Y. Med. Jour.*

The honest effort of one who never writes without teaching and who always writes and teaches well.—*Journal of Insanity.*

To students and practitioners who have read other works this production will prove extremely valuable in time of need, to the former just before examination; to the latter in everyday practice.—*London Lancet.*

Not a compilation, but rather the record of independent opinions and investigations.—*Canadian Practitioner.*

The book is written in the characteristic vigorous style of its able and versatile author.—*American Practitioner.*

Lucid language, clear type, a full index, and, above all, the presentation of the late advances in this department of science, constitute the truly great attractions of this book.—*Albany Med. Annals.*

It is not until the volume has been carefully read, and perhaps re-read, that its true excellence begins to dawn upon the reader.—*Maryland Med. Journal.*

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

"COMPOUND TALCUM" * * * * "BABY POWDER,"

THE

"HYGIENIC DERMAL POWDER"

FOR

INFANTS AND ADULTS.

"Originally investigated and its therapeutic properties discovered in the year 1868, by Dr. Fehr, and introduced to the medical and the pharmaceutical professions in the year 1873."

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER BOX, PLAIN, 25 Cents; PERFUMED, 50 Cents.
PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

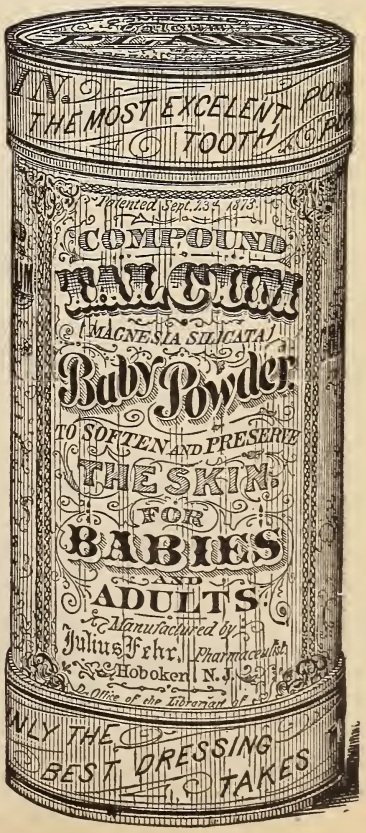
SOLD BY THE DRUG TRADE GENERALLY.

MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.



BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

For Literature and Samples, address Phenique Chemical Co., St. Louis, Mo.

FOR SALE EVERYWHERE.

STEARNS'

CASCARA AROMATIC

Is a fluid extract (not a cordial, syrup or other *dilute* preparation. of prime and selected two year old bark (Fresh bark contains a ferment which produces griping.).

Cascara Aromatic is sweet in taste (which children and women especially appreciate.) instead of being bitter, as is the ordinary fluid extract, powerful (Its dose is only ¼ to 1 fluidrachm.) yet gentle in effect, and in addition does not gripe (This, next to its taste, is its most valuable property, as ordinary bitter fluid extracts do.).

SURELY AN IDEAL LAXATIVE.

Samples and Literature Free.

SVAPNIA IS FOR SALE BY DRUGGISTS GENERALLY.

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

OD CHEM. CO., NEW YORK.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill; Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Dr. Pean.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days, A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRI' CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

WASHINGTON, D. C.

Derangements of the Liver.

HORSFORD'S ACID PHOSPHATE.

has been used with good effect in diseases of the liver, and biliary disorders, where an acid treatment is indicated, and has especially proved a desirable medium to employ in chronic hepatic affections. By its action it stimulates the liver and promotes an increased flow of bile.

The Acid Phosphate is far superior to the nitro-muriatic acid of the pharmacopœia, in that it serves to assist digestion, and promotes in a marked degree the healthful action of the digestive organs.

Dr. O. G. CILLEY, of Boston, says: "I give it in all cases where there is derangement of the liver, with the most remarkable success. With my patients it has agreed wonderfully."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

7 Reasons why Papoid is superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

CHAPPING, ITCHING, DANDRUFF,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. Imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1;**" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S,*" viz., "*Ext. Carnis Fl. Comp. (Colden.)*" A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges, will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 Grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two **FLUID** drachms, in **WATER**, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Dr. Pean.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE,

A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little. Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

Webber-Pepsin, S. & D.

Standard

1 to 6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

Dose: 1/8 to 2 Grains.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg-albumen in accordance with the conditions of the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin

Druggists will find it to their interest to dispense this product because of its *ease of manipulation*, its great digestive power, its permanency, *its perfect solubility*, and its *reasonable price*, the latter being less—considering the digestive power and purity—than that of any other Pepsin on the market. We invite critical comparative tests with other high grade Pepsins.

Although further investigations based upon the Webber process have enabled us to produce Pepsin capable of digesting from 20,000 to 30,000 times its weight of coagulated egg-albumen, we have adopted 1 to 6000 as our standard for the Webber-Pepsin because this already far exceeds the digestive power of any other Pepsin yet introduced and especially because the production of a Pepsin of a still higher digestive power disproportionately increases its cost.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always he freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

Summary of Notes on

The Perfectly Prepared Pill.

CONCLUSIONS:

The Methodical Treatment of Disease calls for the therapeutic agents of **Advanced Pharmacy**, and these must be of as nearly absolute a quality as can be obtained.

Purity is Essential to the Perfect Pill, for, without it, safe, effective, exact and uniform results are not to be obtained.

Medicines should be "Arms of Precision." The physician cannot push his remedies to the limit of safety unless he has perfect confidence in their purity and accuracy.

Ready and Complete Disintegration of the pill in the stomach is obtained not only through a perfect

SOLUBILITY of the pill mass and its coating, but through
SOUNDNESS in the medicaments employed;
SUITABILITY as to the excipients chosen, and
SPECIAL SKILL, so applied as to prevent chemical changes during the time of preparation or afterward.

The W. H. S. & Co. Pill

is well liked by physicians and pharmacists because they know that its *quality, weight, uniformity* and *stability* can be fully depended upon. For the same reasons, physicians have deemed it proper, in prescribing,

To Specify the W. H. S. & Co. Preparations.

Attention is asked to the following selections from our pill list. These preparations together with many others of the same make, are manufactured in strict accordance with the views we have ventured to express in these notes.

Pil. Phenacetine et Salophen, 5 grs., "W. H. S. & Co."

For Influenza (*"la grippe"*), **Acute, Articular Rheumatism, Neuralgia, Migraine, Pertussis,** and all **Painful Febrile Conditions** whether or not dependent upon a **Rheumatic Diathesis.** [Pills of 2 1-2 and 5 grs. each, of equal parts of salophen and phenacetine.]

Pil. Terpin Hydrat., "W. H. S. & Co."

Exhibited in Bronchitis, Catarrh, Coughs, Colds, Asthma, and all **Respiratory Affections.** Unlike terebinthina and some of its derivatives, **no unpleasant symptoms** follow its use. [Pills of 2 and 5 grains.]

Pil. Creasoti, "W. H. S. & Co."

Prescribed for Pulmonary Tuberculosis, Pulmonary Phthisis, and **Acute** and **Chronic Diseases** of the **Bronchia.** It adds to the **Appetite** and **Weight.** [Pills of ½ and 1 grain.]

Pil. Phenacetine (Bayer), "W. H. S. & Co."

Administered in **All Forms of Fever, Pain, Rheumatism** or **Neuralgia,** and in all maladies in which an **Antipyretic** or **Analgesic** is indicated. It is also valuable in **Pertussis.** [Pills of 2, 3, 4 and 5 grains.]

Pil. Hydrargyri Tannici, "W. H. S. & Co."

Advantageously used in all cases in which **Mercury** is **required.** Especially valuable in the **prolonged treatment** called for in the various forms of **Syphilis** as it neither salivates nor disturbs the digestive organs. [Pills of 1 gr. each.]

W. H. Schieffelin & Co., New York.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well-known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

SMITH, KLINE & FRENCH CO., PHILADELPHIA.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

Send for catalogue, and address

DAVID STREETT, M. D., Dean,

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 Grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16 page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Dr. H. Jackson.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoriti-forme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . . 1 gr. | Concentrated Pepsin 1 r.
Ext. Nux Vomica . . ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

Baltimore, Md., U. S. A.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition."**

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR
BUFFALO LITHIA SPRINGS, VA.

Dr. J. FEHR'S
"COMPOUND TALCUM" * * * * "BABY POWDER,"

THE

"HYGIENIC DERMAL POWDER"

FOR

INFANTS AND ADULTS.

"Originally investigated and its therapeutic properties discovered in the year 1868, by Dr. Fehr, and introduced to the medical and the pharmaceutical professions in the year 1873."

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER BOX, PLAIN, 25 Cents; PERFUMED, 50 Cents.
PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

DR. WM. A. HAMMOND'S
PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cable cars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)		Soda.....1-3 Grains.	
Distilled Water.....35 "		Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.		Hyocholic Acid.....1-20 "	

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

A Sample of Hydroleine will be sent free upon application, to any physician (enclosing business card) in the U. S.

"CURIOUS QUESTIONS."

An Encyclopaedia of the Rare and Curious.

Third Improved Edition Now Ready.

"Curious Questions" fills a niche wholly its own. Its mission is to tell you hundreds of things that you ought to know, and don't; to enlarge your conversational powers; to brighten your intellect, and lead you to further research in the best channels of thought, and to keep you from exposing your ignorance on many questions of daily recurrence.

Do not think you are too wise to profit by it, when Rev. Dr. Andrew Preston Peabody, of Harvard University, says of "Curious Questions:"

> **"I find that some of the questions are such as I could not have answered, or have known where to look for their answers. Such a book will be of inestimable service and value to any intelligent person, young or old."**

The new de luxe editions (25 full-page illustrations) are unexcelled for presentations. Prices, $4.00, $6.00 and $8.00 a set.

Sold by subscription through our regularly authorized solicitors, or supplied direct by the publishers. Illustrated descriptive catalogue and sample pages free. *Agents wanted.* Address the sole publishers,

Keystone Publishing Company,

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid.* They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp , C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges, will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.

J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed

T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

MEDICINAL PYROZONE.

John Freind.

THIS name is applied to a preparation of peroxide of hydrogen containing three per cent. of H_2O_2 combined in such a way as to render the solution stable, and, with very ordinary precautions, the last portions of a bottle will be of fully the same strength as the first. This quality, which is unusual in solutions of peroxide of hydrogen, is due to the care exercised in the manufacture of the Medicinal Pyrozone, and is of great importance, as a preparation which is growing weaker daily, is not only a great inconvenience, but a positive danger. The Medicinal Pyrozone, when not in use, should be kept from contact with organic matter.

Peroxide of hydrogen was discovered and described in the year 1818 by the illustrious French chemist, Baron THENARD. B. W. RICHARDSON, M. D., (*Asclepiad*) says: "In 1860 I made my first report to the Medical Society of London, and, in 1862, I made a second report on the medicinal use of the peroxide. I had by this time used it in two hundred and twenty-three cases of disease, including phthisis, diabetes, anæmia, sub-acute and chronic rheumatism, strumous enlargement of the cervical glands, mesenteric disease, pertussis, chronic bronchitis, chronic laryngitis, mitral disease, and dyspepsia. In epitome of results I drew the conclusions: That in diabetes the peroxide reduced the specific gravity of the urine, while it rather increased the quantity: that in chronic and sub-acute rheumatism is afforded relief; that in valvular disease of the heart with pulmonary congestion it gave relief to the dyspnœa; that in mesenteric disease; and in jaundice it caused an improvement in the digestion; that in pertussis its effect for good was very remarkable, since it cut short the paroxysms of cough, and seemed decidedly to shorten the period of the disease; that in chronic bronchitis it lessened the dyspnœa, and rendered the expectorated matter less tenacious; that in chronic laryngitis it gave pain on being swallowed, and did not appear to be useful; that in anæmia it did not of itself render any service but favored the good effect of iron; that in the first stage of phthisis it caused improvement in the digestion, and in the later stages gave unquestionable and even wonderful relief to the breathlessness and oppression, acting, in fact, like an opiate without narcotism, and assisting oxidation.

In the discussion which followed upon the reading of this paper I was warmly supported in several points by Drs. GIBBON, SYMES, THOMPSON, and GIBB. all of whom had been prescribing the peroxide on the suggestion made in my previous paper of 1860. Dr. GIBB bore special testimony to its value in affording relief during the last stage of phthisis, for which I had recommended it in the case of a member of his own family. But the most important new observation I had to communicate to the Society in 1862 was that in free and frequently repeated doses the peroxide could be made to produce a modified salivation. a fact which led to two suggestions; firstly, that in the use of mercurial and iodide preparations it was the chlorine or iodine in them which caused the ptyalism; secondly, that the peroxide would be a good substitute for mercury and the iodides in the treatment of syphilis.

In testing the action of the peroxide on natural organic structures which liberate oxygen from it, I observed, as related above, that the fluid oxygen causes, in some instances, decomposition of the organic matter. The same fact was observed with abnormal organic material like pus. When pus is placed for observation under the microscope. mixed with the neutral peroxide solution, the phenomena are most interesting. The pus corpuscles are, for a time, driven about as if they were alive. They move in all directions, assume ovoid shapes as they squeeze through masses that may obstruct their course, and after many variations of form and movement come to a standstill, like amorphous matter, dead, so to speak, and entirely disorganized. This effect of the peroxide in destroying pus cells led me very early in these researches to use the solution for the treatment of suppurating surfaces, and with great success."

Many other observers have testified to the value of this remarkable substance, not only as a disinfectant in the treatment of wounds, etc., but as a curative agent in a great number of infectious diseases,

---

DR. THOMAS S. K. MORTON, in an article on the "Treatment of Leg Ulcers." N. Y. *Med Journal*, page 26, July 2, 1892, says: "Next, the ulcerated surfaces are subjected to the powerful but harmless antiseptic action of a spray of full strength (15 volume) peroxide of hydrogen solution. Pouring on of the agent is almost as efficient, but very wasteful. If the spray is employed, however, it is essential to use an atomizer of which every part is made of hard rubber, as the powerful oxidizing qualities of the solution will almost immediately destroy any metallic parts with which it may come in contact. The ulcer, having been thus sprayed until active effervescence ceases, is then gently washed off by a stream of simple water, or by a pledget or mop of absorbent cotton saturated with the same. This carries away all detritus loosened up by the action of the peroxide."

McKESSON & ROBBINS, AGENTS,
NEW YORK.

Pure peroxide of hydrogen is a liquid of a higher specific gravity than that of water; consequently, the common term "15 volume solution" is very misleading; and, as a fact, we find that analyses of these solutions show that, instead of the three per cent. of the peroxide which they should contain, they seldom show more than two per cent.; and very frequently but one and one-half per cent., or but one-half of the proper quantity.

Medicinal Pyrozone always contains three per cent. of the pure peroxide of hydrogen by weight, and can be relied upon in all cases as being of this strength.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRI' CORDIAL is Indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Conorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

Platt's Chlorides,

The True Disinfectant.

Twelve years of practical daily use, by tens of thousands of intelligent physicians, and by hundreds of thousands of careful housekeepers, has established beyond doubt the value, the usefulness and the superiority of Platt's Chlorides.

An odorless liquid, clean, stainless, powerful, efficient and economical, it is peculiarly adapted to all the sanitary needs of the sick-room, and the hygienic demands of the household.

Platt's Chlorides is sold in quart bottles only, and by nearly every apothecary in every city, town or village in the United States. Should there be any practising physician anywhere who may not, as yet, personally know its value, a sample, with descriptive circulars, etc., will be gladly furnished free.

Address, giving both Post and Express Offices,

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

Baltimore, Md., U. S. A.

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

GENITO-URINARY DISEASES

True Santal and Palmetto in a pleasant aromatic vehicle.

Dose—Teaspoonful four times a day.

SANMETTO

SPECIAL

PRE-SENILITY,
Prostatic Trouble,
IRRITABLE BLADDER,
Urethral Inflammation.

OD CHEM. CO., NEW YORK.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.

J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M. D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M. D., LL. D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

Send for catalogue, and address

403 N. Exeter St., Baltimore, Md.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

IMPORTERS, WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

SUPERIOR TO THE MURIATE:

The Phenate of Cocaine

Not being absorbed into the organism when applied locally its anæsthetic effect is prolonged, and there is an absence of cocaine intoxication.

A NEW NON-TOXIC MEANS IN

PSORIASIS AND OTHER SKIN DISEASES.

GALLACETOPHENONE

FULL NOTES SENT FREE ON RECEIPT OF POSTAL CARD

THE PHENATE OF COCAINE.

Von Bergmann.

"We know that phenic acid, from the point of view of its local action, presents certain analogies with cocaine; like the latter, it produces ischæmia and insensibility of the tissues. We would therefore expect that a combination of the two substances, under the form of phenate of cocaine, would have therapeutic properties, superior to those of the muriate of cocaine. This has been found to be the case by a Bavarian physician, DR. VON OEFELE, who has for some time past employed the phenate of cocaine exclusively in the place of the muriate."

He has found that the phenic salt exercises an analgesic action much more persistent than that of the muriate, while the chances of producing toxic effects are much less. Gluck was accustomed to add carbolic acid to his solutions of cocaine for the purpose of diminishing the chances of producing disagreeable results. These properties and advantages are explained by the fact that the phenic salt is almost entirely insoluble in water. Not being dissolved by the juices of the organism, the phenate of cocaine, employed as a local application, is absorbed but little or not at all, whence the absence of intoxication and the persistence of the analgesic action, which may last as long as thirty-six hours. Phenate of cocaine may be given internally as well as in hypodermic injection.—*La Semaine Med.*

GALLACETOPHENONE, A NEW DERMATO-THERAPEUTIC AGENT.

BY HERMANN GOLDENBERG, M. D.

It is well known that pyrogallic acid is by no means a harmless drug. After its introduction into dermatological practice NEISSER lost a patient after one application. The patient died on the third day with symptoms of intoxication. VIDAL has likewise reported the death of a patient, eighteen years old, who had used a ten per cent. pyrogallic ointment for two weeks. This poisonous effect of pyrogallic acid is to be attributed to the great readiness with which it is oxidized in alkaline solutions (being so intensely reducing).

Gallacetophenone does not possess this quality and is absolutely harmless, as has been proven by experiments on animals.

It displays strong antiseptic qualities. A one per cent. solution added to chopped meat prevented its becoming putrid for twenty-one days, and destroyed the *Streptococcus aureus* within twenty-four hours.

Since the middle of October I have employed it, both in private and in dispensary practice, on at least thirty patients suffering from various skin diseases.

On account of its resemblance to pyrogallic acid, it seemed to be indicated in psoriasis. I have been so much more inclined to use it in that disease, since VON REKOWSKI, who tried it in a few cases only, maintains "that the effect of this new preparation (used as a ten per cent. ointment) is noticed within twelve hours."

Altogether, I have thus employed it in twelve cases of psoriasis—in all of them with good results. Within a few days the patches became paler and thinner, the desquamation ceased or became less, and involution took place in the centers. Usually after the lapse of from ten to twelve days only a slight hyperæmia was left. Within from two to three weeks the patches disappeared entirely without leaving any pigmentation.

A ten per cent. ointment did not produce any marked irritation or discolor the skin. It stains the clothes slightly yellowish, much less than pyrogallic acid or chrysarobin. In the case of psoriasis of the face and scalp it really acted like a specific. The eruption, which was quite profuse, disappeared within five days. A ten per cent. ointment was applied twice daily. There was no other treatment

Another patient with a universal psoriasis of sixteen years' standing, who applied to my department at Mount Sinai Dispensary for some other trouble, was induced to use a ten per cent. salve of gallacetophenone for the forehead and scalp, which were thickly covered with psoriatic patches. When he returned, two weeks later, there was nothing left but a pigmentation of the forehead, while the psoriasis of the body which had not been treated was *in statu quo ante.*

My friend, DR. G.T. ELLIOT, has, at my request, used gallacetophenone on a patient with psoriasis of eight years' standing, distributed over the trunk, knees, elbows, scalp, and face in patches of various sizes. The case had been under treatment the whole time and had proved exceedingly rebellious. Arsenic caused an increase of inflammatory symptoms. Pyrogallic acid had been used with but moderate success. Chysarobin did well, if used persistently. At the time (November 21st) when the use of a ten per cent. gallacetophenone ointment was begun, the patches were bright red, burning, and with abundant desquamation. A week later the patches were paler and breaking up into small papules. The centers had undergone involution and the desquamation was very little Under the further use the improvement continued. DR. ELLIOT concludes his report with the following words: "From this slight experience, gallacetophenone appears to me to promise to be the most satisfactory local remedy for psoriasis and superior to all others. It produces no inflammatory reaction or pigmentation, but seems to influence immediately the lesions."

From my experience, I feel justified in recommending gallacetophenone as an excellent remedy for psoriasis, for it acts in some cases more promptly than chrysarobin—in all the cases which I have treated, as well if not better than the other remedies at our disposal. As it is harmless and does not discolor the skin or hair, I hope it will be found to be one of the best local remedies for psoriasis of the body, face, and scalp.

My results in a number of cases of eczema psoritiforme and seborrhoicum have been so gratifying and encouraging that I should like to include these affections in its field of usefulness.—*N. Y. Med. Jour.*

JULIA W. CARPENTER, M. D., (*Cinn. Lancet Clinic*), also speaks of the rapid, almost specific, action of GALLACETOPHENONE in a very rebellious case of psoriasis.

FULL NOTES SENT ON REQUEST.

McKESSON & ROBBINS, NEW YORK.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system. and thus relieves all abnormal conditions.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

Derangements of the Liver.

HORSFORD'S ACID PHOSPHATE.

has been used with good effect in diseases of the liver, and biliary disorders, where an acid treatment is indicated, and has especially proved a desirable medium to employ in chronic hepatic affections. By its action it stimulates the liver and promotes an increased flow of bile.

The Acid Phosphate is far superior to the nitro-muriatic acid of the pharmacopœia, in that it serves to assist digestion, and promotes in a marked degree the healthful action of the digestive organs.

Dr. O. G. CILLEY, of Boston, says: "I give it in all cases where there is derangement of the liver, with the most remarkable success. With my patients it has agreed wonderfully."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Rumford Chemical Works, Providence, R. I.

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

LITTELL'S LIVING AGE

1844.

1893.

In **1893** will enter its **YEAR OF JUBILEE,** hence a retrospective glance at its history may be now appropriately taken.

In establishing this magazine its founder sought to present in convenient form a history of the world's progress, by selecting from the whole wide field of European Periodical Literature, the best articles by the most eminent writers in every department, Biography, History, Literature, Travels, Science, Politics, Art, Criticism, in a word, "*de omnibus rebus*," including Fiction and Poetry.

The plan thus originally proposed has been faithfully followed during the forty-nine years of its existence, with what measure of success the uniformly high character of the articles presented to its readers for 2530 Consecutive Weeks and the contents of its 195 Octavo Volumes sufficiently attest.

A. D. 1844.

"I have never seen any similar publication of equal merit."—GEORGE TICKNOR, *August, 1844.*

A. D. 1869.

"Still as fresh, as racy, as enchanting, and full to the brim of scientific value, as when it rejoiced in its first year." ALFRED B. STREET, in *Albany Evening Journal, Nov., 1869.*

A. D. 1892.

"Only the best has ever filled its pages; the best thought, rendered in the purest English. Nothing poor or unworthy has ever appeared in the columns of *The Living Age.*"—THE PRESBYTERIAN, *Philadelphia, 13th April, 1892.*

In the coming year THE LIVING AGE will continue to be

THE REFLEX OF THE AGE IN WHICH IT LIVES.

Fiction will still occupy its accustomed place in the magazine and the exquisite short stories which appear in every number and which have been so well received during the past year will remain a prominent feature of this department

OBSERVE! THE LIVING AGE is a *Weekly Magazine of sixty-four pages,* giving more than

THREE AND A QUARTER THOUSAND

double column octavo pages of reading matter yearly, forming four large volumes, thus presenting a mass of matter

UNEQUALLED IN QUALITY AND QUANTITY

by any other publication in the country.

The Boston TRANSCRIPT *of Sept. 3, 1892, says of* THE LIVING AGE: "*No well-ordered and intelligent household shou d be without this publication.*"

That every such household may be induced to subscribe for the magazine, extend its sphere of usefulness and double its circulation during the coming year, the publishers make the following

OFFERS EQUAL TO THE BEST EVER PRESENTED

for the considerasion of an intelligent and cultured class of American readers. *These splendid offers are open to all subscribers, old and new alike.*

Offer No. 1. $12.00 { Littell's Living Age, one year, postpaid . . . . . $8.00 / Ridpath's History of the U. S of America . . . . . 4.00 } For **$8.50**

Offer No. 2. $15.50 { Littell's Living Age, one year, postpaid . . . . . $8.00 / The Wonderful Story of Old . . . . . 7.50 } For **$9.00**

Offer No. 3. $19.50 { Littell's Living Age, one year, postpaid . . . . . $8.00 / Ridpath's History of the U. S. of Ame.ica . . . . 4 00 / The Wonderful Story of Old . . . . . 7 50 } For **$10.50**

No one should delay in at onee taking advantage of the remarkable opportunities thus presented of obtaining this large amount of the most valuable reading matter at a nominal price.

Offer No. 4. { We will send RIDPATH'S HISTORY *free* to anyone sending us two *new* subscribers to *The Living Age.* and the subscription price, $16.00: or we will send a set of "The Wonderful Story of Old," for a list of three *new* subscribers and $24.00.

"RIDPATH'S HISTORY OF THE UNITED STATES,"

by JOHN CLARK RIDPATH, LL. D., author of the "History of the World," etc., has received the emphatic endorsement of leading educators and of the press of America. REV. CHAS. W. BENNETT, D. D., *Professor of History, Syracuse University,* says "Whether judged by the thoroughness of research, the accuracy of statement, or the purity of style it occupies a foremost place among United States Histories."

A SPECIAL EDITION of this great work is being prepared for our use. Send for descriptive circulars.

"THE WONDERFUL STORY OF OLD,"

by MARCUS WILSON, author of "Wilson's Historical Series," "Philosophy of History," etc., etc., is a description of the Scenes, Incidents and Events recorded in the Holy Bible, to which is added much valuable matter; the whole enriched with poetical gems, and the best thoughts of Biblical scholars and critics.

This splendid work, richly illustrated after the great masters, is published in two volumes. beautifully printed on the best book paper, and handsomely bound in heavy cloth. Vol. I., 660 pages Vol. II., 626 pages

The prices given in the above "OFFERS" *include postage on* THE LIVING AGE *only. The books must be sent the subscriber's expense.*

THE LIVING AGE is published weekly at $8.00 a year, free of postage.

☞ **TO NEW SUBSCRIBERS for the year 1893,** remitting before Jan. 1, will be sent *gratis* the two October issues containing a powerful story by Frank Harris, *editor of* THE FORTNIGHTLY REVIEW, *entitled* PROFIT AND LOSS, and also the numbers of 1892 published after the receipt of their subscriptions.

☞ The publishers continue their popular clubbing arrangements whereby one or more other periodicals may be obtained at greatly reduced prices. **They will send THE LIVING AGE and the MEDICAL and SURGICAL REPORTER, each one year, postpaid for $11 25.**

☞ Clubbing rates and circulars more fully describing the above named works will be sent on application Sample copies of LIVING AGE 15 cents each.

Address **LITTELL & CO., 31 Bedford St., Boston.**

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden)."* A Sample of COLDEN'S BEEF TONIC will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid*. They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always he freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK:)

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES: EPILEPSY, UTERINE CONGESTION, HEADACHE, AND ALL CONGESTIVE, CONVULSIVE AND REFLEX NEUROSES.

This preparation produces results, which can not be obtained from the use of commercial Bromide substitutes.

DOSE.—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK'S FUCUS MARINA

(ELIX: FUCI MAR: PEACOCK.)

From Sea Weed. **Uses: Malaria, Phthisis, Etc.**

An ALLY of quinine—quinine CHECKS the Malarial Chill, Fucus Marina ELIMINATES the Malarial CAUSE; and thus prevents the recurrence of the Chill *after* it has been *checked* by quinine.

An INVALUABLE REMEDY in the treatment of Phthisis—it arrests the decay of lung tissue, diminishes the fever, lessens the cough, abates the soreness in the lungs, improves the appetite, and impedes the progressive emaciation.

DOSE.—One Teaspoonful IN WATER, four times a day.

CHIONIA FROM CHIONANTHUS.

Uses: Biliousness, Jaundice, Dyspepsia, Constipation, and all Diseases Caused by Hepatic Torpor.

CHIONIA stimulates the Liver and restores it to a healthy condition, without debilitating the system by Catharsis; does not purge, per se, but under its use the Liver and Bowels gradually resume their normal functions.

DOSE.—One Fluid Drachm three times a day.

PEACOCK CHEMICAL CO., ST. LOUIS.

MEDICINAL PYROZONE.

Dr. Pozzi.

THIS name is applied to a preparation of peroxide of hydrogen containing three per cent. of $H_2 O_2$ combined in such a way as to render the solution stable, and, with very ordinary precautions, the last portions of a bottle will be of fully the same strength as the first. This quality, which is unusual in solutions of peroxide of hydrogen, is due to the care exercised in the manufacture of the Medicinal Pyrozone, and is of great importance, as a preparation which is growing weaker daily, is not only a great inconvenience, but a positive danger. The Medicinal Pyrozone, when not in use, should be kept from contact with organic matter.

Peroxide of hydrogen was discovered and described in the year 1818 by the illustrious French chemist, Baron THENARD. B. W. RICHARDSON, M. D., (*Asclepiad*) says: "In 1860 I made my first report to the Medical Society of London, and, in 1862, I made a second report on the medicinal use of the peroxide. I had by this time used it in two hundred and twenty-three cases of disease, including phthisis, diabetes, anæmia, sub-acute and chronic rheumatism, strumous enlargement of the cervical glands, mesenteric disease, pertussis, chronic bronchitis, chronic laryngitis, mitral disease, and dyspepsia. In epitome of results I drew the conclusions: That in diabetes the peroxide reduced the specific gravity of the urine, while it rather increased the quantity: that in chronic and sub-acute rheumatism is afforded relief; that in valvular disease of the heart with pulmonary congestion it gave relief to the dyspnœa; that in mesenteric disease; and in jaundice it caused an improvement in the digestion; that in pertussis its effect for good was very remarkable, since it cut short the paroxysms of cough, and seemed decidedly to shorten the period of the disease; that in chronic bronchitis it lessened the dyspnœa, and rendered the expectorated matter less tenacious; that in chronic laryngitis it gave pain on being swallowed, and did not appear to be useful; that in anæmia it did not of itself render any service but favored the good effect of iron; that in the first stage of phthisis it caused improvement in the digestion, and in the later stages gave unquestionable and even wonderful relief to the breathlessness and oppression, acting, in fact, like an opiate without narcotism, and assisting oxidation.

In the discussion which followed upon the reading of this paper I was warmly supported in several points by Drs. GIBBON, SYMES, THOMPSON, and GIBB, all of whom had been prescribing the peroxide on the suggestion made in my previous paper of 1860. Dr. GIBB bore special testimony to its value in affording relief during the last stage of phthisis, for which I had recommended it in the case of a member of his own family. But the most important new observation I had to communicate to the Society in 1862 was that in free and frequently repeated doses the peroxide could be made to produce a modified salivation. a fact which led to two suggestions: firstly, that in the use of mercurial and iodide preparations it was the chlorine or iodine in them which caused the ptyalism; secondly, that the peroxide would be a good substitute for mercury and the iodides in the treatment of syphilis.

In testing the action of the peroxide on natural organic structures which liberate oxygen from it, I observed, as related above, that the fluid oxygen causes, in some instances, decomposition of the organic matter. The same factwas observed with abnormal organic material like pus. When pus is placed for observation under the microscope, mixed with the neutral peroxide solution, the phenomena are most interesting. The pus corpuscles are, for a time, driven about as if they were alive. They move in all directions, assume ovoid shapes as they squeeze through masses that may obstruct their course, and after many variations of form and movement come to a standstill, like amorphous matter, dead, so to speak, and entirely disorganized. This effect of the peroxide in destroying pus cells led me very early in these researches to use the solution for the treatment of suppurating surfaces, and with great success."

Many other observers have testified to the value of this remarkable substance, not only as a disinfectant in the treatment of wounds, etc., but as a curative agent in a great number of infectious diseases.

DR. THOMAS S. K. MORTON, in an article on the "Treatment of Leg Ulcers." N. Y. *Med Journal*, page 26, July 2, 1892, says: "Next, the ulcerated surfaces are subjected to the powerful but harmless antiseptic action of a spray of full strength (15 volume) peroxide of hydrogen solution. Pouring on of the agent is almost as efficient, but very wasteful. If the spray is employed, however, it is essential o se an atomizer of which every part is made of hard rubber, as the powerful oxidizing qualities of the solution will almost immediately destroy any metallic parts with which it may come in contact. The ulcer, having been thus sprayed until active effervescence ceases, is then gently washed off by a stream of simple water, or by a pledget or mop of absorbent cotton saturated with the same. This carries away all detritus loosened up by the action of the peroxide."

McKESSON & ROBBINS, AGENTS,

NEW YORK.

Pure peroxide of hydrogen is a liquid of a higher specific gravity than that of water; consequently, the common term "15 volume solution" is very misleading; and, as a fact, we find that analyses of these solutions show that, instead of the three per cent. of the peroxide which they should contain, they seldom show more than two per cent.; and very frequently but one and one-half per cent., or but one-half of the proper quantity.

Medicinal Pyrozone always contains three per cent. of the pure peroxide of hydrogen by weight, and can be relied upon in all cases as being of this strength.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

THE APOLLINARIS CO., LD., LONDON.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

TOURS THROUGH MEXICO

FEBRUARY 1st.—An all rail trip via St. Louis, Texas, Monterey, etc., returning via New Orleans and Florida.

MARCH 1st.—Through Florida and Cuba to Mexico, returning via Hot Springs and Chicago.

These tours take in more than a thousand miles of the finest scenery in Mexico

including the famous Lake region never visited by any other party.

These are strictly *limited in size* and select—Ladies and semi-invalids are especially cared for.

COLUMBIAN WORLD'S FAIR

We have arranged to run a Pullman train every Wednesday, from New York and Philadelphia, at a rate of $50 and upwards, including fare, and room and board at one of the best hotels near the grounds—Prospectus now ready.

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid.* They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

THE SECRET OF ITS SUCCESS

(we refer to MERCK'S BULLETIN) is its distinctive character. Some journals are devoted to the expansion of a single man's ideas or the advancement of a special theory. MERCK'S BULLETIN is a comprehensive, well-rounded, clearly-outlined review of the entire field. It offers just what the busy physician or surgeon desires to know. This is the reason that many hundreds of new names are added every month to its subscription list.

If you do not know the journal and want to examine it, a copy will be cheerfully forwarded without expense.

Summary of Notes on

The Perfectly Prepared Pill.

CONCLUSIONS:

The Methodical Treatment of Disease calls for the therapeutic agents of **Advanced Pharmacy**, and these must be of as nearly absolute a quality as can be obtained.

Purity is Essential to the Perfect Pill, for, without it, safe, effective, exact and uniform results are not to be obtained.

Medicines should be "Arms of Precision." The physician cannot push his remedies to the limit of safety unless he has perfect confidence in their purity and accuracy.

Ready and Complete Disintegration of the pill in the stomach is obtained not only through a perfect

SOLUBILITY of the pill mass and its coating, but through
SOUNDNESS in the medicaments employed;
SUITABILITY as to the excipients chosen, and
SPECIAL SKILL, so applied as to prevent chemical changes during the time of preparation or afterward.

The W. H. S. & Co. Pill

is well liked by physicians and pharmacists because they know that its *quality, weight, uniformity* and *stability* can be fully depended upon. For the same reasons, physicians have deemed it proper, in prescribing,

To Specify the W. H. S. & Co. Preparations.

Attention is asked to the following selections from our pill list. These preparations together with many others of the same make, are manufactured in strict accordance with the views we have ventured to express in these notes.

Pil. Phenacetine et Salophen, 5 grs., "W. H. S. & Co."

For **Influenza** (*"la grippe"*), **Acute, Articular Rheumatism, Neuralgia, Migraine, Pertussis,** and all **Painful Febrile Conditions** whether or not dependent upon a **Rheumatic Diathesis.** [Pills of 2 1-2 and 5 grs. each, of equal parts of salophen and phenacetine.]

Pil. Terpin Hydrat., "W. H. S. & Co."

Exhibited in **Bronchitis, Catarrh, Coughs, Colds, Asthma,** and all **Respiratory Affections.** Unlike terebinthina and some of its derivatives, **no unpleasant symptoms** follow its use. [Pills of 2 and 5 grains.]

Pil. Creasóti, "W. H. S. & Co."

Prescribed for **Pulmonary Tuberculosis, Pulmonary Phthisis,** and **Acute** and **Chronic Diseases** of the **Bronchia.** It adds to the **Appetite** and **Weight.** [Pills of ½ and 1 grain.]

Pil. Phenacetine (Bayer), "W. H. S. & Co."

Administered in **All Forms of Fever, Pain, Rheumatism** or **Neuralgia,** and in all maladies in which an **Antipyretic** or **Analgesic** is indicated. It is also valuable in **Pertussis.** [Pills of 2, 3, 4 and 5 grains.]

Pil. Hydrargyri Tannici, "W. H. S. & Co."

Advantageously used in **all cases** in which **Mercury** is **required.** Especially valuable in the **prolonged treatment** called for in the various forms of **Syphilis** as it neither salivates nor disturbs the digestive organs. [Pills of 1 gr. each.]

W. H. Schieffelin & Co., New York.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natur[illegible]bination and in a fluid form. It has a bright yellow color, perfectly clear, free from sedime[illegible] with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.
